

A company with an unflinching commitment to quality, innovation, and customer satisfaction, Havells India Limited has today emerged as a dominant player in the Fast Moving Electrical Goods industry. The company manufactures a number of products ranging from Cables, Wires and Switchgear in domestic and industrial segments, to Fans, Water Heaters, Small Appliances, Air coolers, Personal Grooming, Home Automation, Switches, LED lighting \& fixtures in the consumer facing segments. With the acquisition of Lloyd, and the entry into the Water Purifier category, the company has become a fine example of successful transition and transformation from a Fast Moving Electrical Goods manufacturer to a true Consumer Durables company, steadily spreading its operations across India.

Havells started its operations in the 1970s and since then, the company has used a judicious mix of organic growth and inorganic opportunities to boost revenues and scale up business. The company today owns a range of established and prestigious brands like Havells, Lloyd, Crabtree and Standard that are sold through its extensive network of dealers and retailers spread across the country. Havells has 12 state-of-the-art manufacturing units in the country located at Haridwar, Baddi, Sahibabad, Faridabad, Assam, Alwar and Neemrana. These units manufacture globally acclaimed products, synonymous with excellence and precision.

The company has a strong domestic presence with 43 Branch offices employing close to 6,500 professionals across the country supported by over 7,600 dealers and distributors with world-class service network in 400 cities across India. Given the enormous size, scale and reach of the operations, Havells today boasts of more than 400 exclusive brands shop known as Havells Galaxies to provide better shopping experience to our consumers.

Havells Introduces New HIM Series Moulded Case Circuit Breaker is designed and manufactured to world class standard, keeping in mind the complex requirement of electrical system of present and future ensuring reliability which can give uninterrupted service through out product life, meeting all the stresses that the system encounters.

HIM Series MCCB, perfect blend of aesthetics, features and performance, covers a range of 16 A to 800 A with the high breaking capacity upto 85 kA with Icu=lcs=100\% that fully complies with National and International standards. These MCCBs along with the high level of breaking capacity are thermal adjustable and of compact size that makes it compatible for various load requirements to meet varied application needs in distribution networks.

## Features:

- High breaking capacity up to 85 kA with lcs=100\% Icu
- Thermal Adjustability in entire range
- Rated Insulation Voltage, Ui $=1000 \mathrm{~V}$
- Rated Operational Voltage, Ue $=690 \mathrm{~V}$
- Impulse Withstand Voltage, Uimp $=8 \mathrm{kV}$
- Standardized Height of Products by Frame (AF)

## Range :

- 16 A - 800 A in 5 Frame (AF) Sizes

## Specification :

IS / IEC 60947-1 \& 2

## Essential for Today, Potential for Tomorrow

## Advanced Breaking Performance and Various Selectivity

- Product Range: 16 A - 800 A in 5 Frame (AF) Sizes
- High breaking capacity up to 85 kA with $\mathrm{Ics}=100 \% \mathrm{Icu}$
- Thermal Adjustability in entire range
- Rated Insulation Voltage, Ui $=1000 \mathrm{~V}$
- Rated Operational Voltage, Ue $=690 \mathrm{~V}$
- Impulse Withstand Voltage, Uimp $=8 \mathrm{kV}$
- Standardized Height of Products by Frame (AF)

Rated Short-Circuit Current by AF, (Ics = 100 \% Icu)

## Advanced Breaking Performance and Various Selectivity

## Product Range

- Frame 1: 100 AF (16-100 A)
- Frame 2: 125 AF (16-125 A)
- Frame 3: 250 AF (150-250 A)
- Frame 4: 400 AF (300-400 A)
- Frame 5: 630 AF ( $500-630 \mathrm{~A}$ ), $800 \mathrm{AF}(700-800 \mathrm{~A})$

## Maximized Insulation Performance

- Rated insulation voltage, Ui: $1,000 \mathrm{~V}$
- Rated operational voltage, Ue: 690 V
- Rated impulse withstand voltage, Uimp: 8 kV
- Double Insulation

## High Breaking Capacity

- $\operatorname{Ics}=100 \% \mathrm{Icu}$
- 16-20 kA (100 AF)
- 20-55 kA (125-250 AF)
- 45-85 kA (400-800 AF)

## Cable Insulation Performance Suitability

In case of continuing abnormal conditions such as welding of main contact after trip, handle is not available to move from 'OFF position' in accordance with IEC 60947-2 cable insulation performance. Also, it is possible to maintain easily by checking a contact condition by the handle.

## Adjustable Rated Current

As applying to adjustable rated current design, it is possible to protect circuit optimally according to the load factor. Adjustable range of rated currents.

- 100-250 AF: $80 \%-90 \%-100 \%$ of rated current
- 400-800 AF: $63 \%-80 \%-100 \%$ of rated current

## Dial Sealing Device (Option)

Prevent removal of the protection cover from body
 and any operating of current setting value.

## HIM Type Molded Case Circuit Breakers

## High Performance \& Coordination

Service Breaking Capacity (Ics = 100 \% x Icu)
Service breaking capacity, ' $100 \%$ X Icu' is realized by enlarging breaking capacity with internal limit current device.

- 16-55 kA (Up to 250 AF )
- 45-85 kA (400-800 AF)

## Available to Various Low Voltage System Protections

It is available to adapt various low voltage system protections such as 'Discrimination' and 'Cascading' with limit current characteristic and high breaking capacity.

## Discrimination

It is a low voltage system protection to selectively separate fault point from system to minimize influence of fault. In this protection type, only circuit breaker installed at a fault point is operated while the other feeder can be used continuously.

## Cascading

In this protection type, upstream circuit breakers can be tripped earlier than downstream circuit breaker for back up protection. So, it is applied to the smaller breaking capacity than the calculated value at down stream circuit.

Current Limiting Characteristics

## External Structure and Contents of Nameplate

## Contents of Nameplate

- Ui: Rated insulation voltage
- Uimp: Rated impulse withstand voltage
- Ue: Rated operational voltage
- Icu: Rated short-circuit breaking capacity
- Ics: Service short-circuit
breaking
capacity

## Internal Accessories

## Auxiliary Switch (AUX), Alarm Switch (ALT)

Indicates the status of circuit breaker contacts from a remote position as well as using for electric locking.

## Auxiliary Switch (AUX)

- Indicating ON/OFF status of circuit breaker.
- Status is OFF when TRIP.
- Consists of C contact.

## Alarm Switch (ALT)

- Activated when the circuit breaker has tripped due to an overload, short circuit or ground fault, excepting manual ON/OFF operation.
- Return to original state, when circuit breaker reset.
- Consist of $C$ contact.

## Auxiliary + Alarm Switch (AXT)

- Combined auxiliary switch (AUX.) and Alaram Switch (ALT)

| DC250 V | 0.2 A | 0.2 A |

## Shunt Trip (SHT)

Remotely trip circuit breakers by voltage shunt trip (SHT) device.

## Operation Condition:

- $\mathrm{U} \geq 0.7 \times \mathrm{Un}$ (Apply more than $70 \%$ of the rated voltage.)
- In case of impulse type voltage, apply more than 20 ms

Rated Voltage and Characteristics (100-250 AF)

| Rated Voltage (Un) |  | Power consumption |  |
| :---: | :---: | :---: | :---: |
|  |  | VA (W) | A (A) |
| DC | 24 V | 50.2 | 2.1 |
|  | 48 V | 94.6 | 1.97 |
|  | 60 V | 91.2 | 1.52 |
|  | 100-120 V | 11.8 | 0.1 |
|  | 125 V | 58.1 | 0.47 |
| AC (50/60 Hz) | 100-120 V | 75.2 | 0.63 |
|  | 200-250 V | 64.8 | 0.26 |
|  | 380-480 V | 131 | 0.27 |
| Rated Operational Voltage |  | 0.7-1.1 x Un |  |
| Operating Time |  | 50 ms |  |

Possible Location for Installation

| Type | Pole | SHT | UVT |
| :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { HIM100 } \\ & \text { HIM125 } \end{aligned}$ | 2 | $\square$ | - |
| $\begin{aligned} & \text { HIM100 } \\ & \text { HIM125 } \\ & \text { HIM } 250 \end{aligned}$ | 3/4 | $\square \square$ | $\square 8$ |

| $\begin{gathered} \text { HIM630, } \\ 800 \end{gathered}$ | 2/3/4 | W | $\square$ |

- SHT: Shunt trip
- UVT: Under-voltage trip

## Internal Accessories

## Undervoltage Trip (UVT)

In case circuit voltage is less than the reference value, the circuit breaker will not trip or ON. If circuit voltage falls less than $35 \%$ of Rated voltage (Un), UVT initiates a trip automatically to prevent damage to the load.

## Opening Conditions:

- Operating characteristics are based on IEC 60947-2 standard criteria.
- Trip condition: $U \leq 0.35 \times$ Un
- Fixed: 50 ms (400-800 AF)
- Time Delay: 500-1,000 ms (Up to 250 AF )
- No Trip condition: $U \geq 0.7 \times$ Un
- In $U=0.35 \times$ Un - 0.7 $\times$ Un interval, circuit breaker can be tripped but, does not warrant the operation.

## Closing Conditions:

UVT

## Time Delay Function:

To prevent a mal-function in the short time voltage drop of less than 500 ms .
(Up to 250 AF)

## Rated Voltage and Characteristic (Up to 250 AF)

| Rated Voltage (Un) |  | Power consumption |  |
| :---: | :---: | :---: | :---: |
|  |  | VA (W) | A (mA) |
| DC | 24 V | 0.96 | 40 |
|  | 48 V | 1.1 | 22.7 |
|  | 100-110 V | 2.2 | 20 |
| $\begin{gathered} \mathrm{AC} \\ (50 / 60 \mathrm{~Hz}) \end{gathered}$ | 100-120 V | 5.1 | 42 |
|  | 200-230 V | 6 | 26 |
|  | 380-415 V | 9.6 | 23 |
|  | 440-480 V | 12.5 | 26 |
| Operating Inception Voltage | In the Case of Trip | 0.35-0.7 x Un |  |
|  | In the Case of Closing | $0.85 \times$ Un |  |
| Rated Operational Voltage |  | 0.85-1.1 x Un |  |
| Operating Time |  | $500-1,000 \mathrm{~ms}$ |  |

- Be sure not to use UVT for the electrial interlock system.

## External Accessories

## Locking Device

Padlock Device for Handle (PLD)
This device is used for locking the handle of circuit breakers to OFF position by using padlock. Key lock is applicable upto 3 EA and not be supplied additionally.

Ratings of keylock are as below.

| Type | Application | Padlock Diameter |
| :---: | :---: | :---: |
| ISSLEU0844 | HIM100 - HIM250 | 5 mm |
| ISSLEU0845 | HIM400 - HIM800 | 6 mm |

## Mechanical Interlock

This device interlocks two circuit breakers mechanically.

## Features:

- It prevents two breakers from closing at the same time.
- t turns two breakers all OFF.

Ratings of keylock are as below.

| Type |  |  | Application | Padlock <br> Diameter |
| :---: | :---: | :---: | :---: | :---: |
| 2P | 3P | 4P (NRST) |  |  |
| ISSLEU0825 | ISSLEU0826 | ISSLEU0828 | HIM100 | 5 mm |
| ISSLEU0829 | ISSLEU0830 | ISSLEU0832 | HIM125 |  |

Right Off Lock

Left Off Lock

Double Off Lock

## External Accessories

## Terminal Cover

Terminal cover is the device to insulate circuit breaker terminal from the outside for safety. It is possible to apply IP40 as protection degree of power parts. The connecting method is of long type which is suitable for front connection using wires, busbar.

Long Type

| Type |  |  |  |  |  | Application | Pitch (mm) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 2P |  | 3P |  | 4P |  |  |

Drawings

Long Type (Front Connection)

- 1) For front connection, please use it after removing the mark 1)

## Phase Barrier

Insulation barrier is used for preventing short-circuit fault due to dieletric breakdown between circuit breaker terminals. It improves the performance of terminal phase-to-phase insulation if installed at groove between the terminal of two circuit breakers. It can be easily assembled after the installation of the circuit breaker. In addition, it is used in terminal cover.

| Type |  | Application | $2 P$ | Number of Parts (EA/Set) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2P | 3P | 4P | HIM100 | 1 | $3 P$ |  |
| ISSLU0879 | ISSLU0880 | ISSLU0881 | HP | 2 | 3 |  |
| ISSLU0879 | ISSLU0880 | ISSLU0881 | HIM125 | 1 | 2 | 3 |
| ISSLU0882 | ISSLU0883 | ISSLU0884 | HIM250 | 1 | 2 | 3 |
| - | ISSLU0885 | ISSLU0886 | HIM400 | 1 | 2 | 3 |
| - | ISSLU0885 | ISSLU0886 | HIM630, 800 | 1 | 2 | 3 |

- Additional barrier required for mounting in close contact is supplied as additional options.

## External Accessories

## Rotary Handle

Rotary handle is the device to check for MCCB's ON/OFF/TRIP status from outside of switchgear. There are two types of rotary handle-extended type and direct type. All the rotary handles provide panel door locking and handle locking function by rotating clockwise the rotary handle, the circuit breaker operates "ON". Each rotary handle is divided into these three types the upper line, the right line, and the left line-according to attachment direction of MCCB.

## Direct Rotary Handle (TFG Type)

- 32-250 AF: Attach handle directly to the circuit breaker.
- 400-800 AF: Attach handle to the door of switchgear.

| Type | Application |
| :---: | :---: |
| Upper Line | HIM100 |
| ISSLU0806 | HIM125 |
| ISSLU0809 | HIM250 |
| ISSLU0812 | HIM400 |
| ISSLU0815 | HIM630,800 |
| ISSLU0916 |  |

Direct Rotary Handle

HIM100
HIM125
HIM250

HIM400
HIM800

## Extended Rotary Handle (TFH Type)

Suitable for the case where the distance between circuit breaker and door switchgear is long. The handle is attached to the door of switchgear so there is no trip-button function.

| Type | Application |
| :---: | :---: |
| ISSLU0820 | HIM100 |
| ISSLU0821 | HIM125 |
| ISSLU0822 | HIM250 |
| ISSLU0823 | HIM400 |
| ISSLU0824 | HIM630,800 |

Extended Rotary Handle

Category of Handle in Accordance with Circuit-Breaker's Installation Type
Rotary handle is devided into the following three types according to the direction of power supply.

## How to Operate Handle

- Operating direction: To turn 'ON' the circuit breaker function, rotate handle clockwise.
- Circuit breaker ON: Rotating the handle to ON position. (Figure 1)
- Circuit breaker OFF: Rotating the handle to OFF position. (Figure 2)
- Circuit breaker TRIP: If the circuit breaker is tripped, the handle will be switched to automatically TRIP position. (Figure 3)
- If you rotate the handle to RESET position first after the circuit breaker is tripped (Figure 4) and then rotate the
 handle to ON position, the circuit breaker is operated ON (Figure 1).
- If you need to open door when handle is in the ON state, rotate the RELEASE screw to direction of the arrow first and then open the door (Figure 5).

(Figure 1)

(Figure 2)

(Figure 3)

(Figure 4)

## Locking Device

| Locking Function | OFF State Door Lock | ON State Door Lock | Reverse Interlock | Handle Padlock |
| :---: | :---: | :---: | :---: | :---: |
| Contents | - Impossible to open the switchgear door when the circuit breaker is in the OFF state. <br> - Possible at RESET position <br> - It is possible to open the switchgear door after rotating the handle to RESET. | - Impossible to open the switchgear door when the circuit breaker is in the ON state. <br> - It is possible to open the switchgear door after rotating the RELEASE screw. | - Impossible to put the circuit breaker in the state "ON" when the switchgear door is open. | - Padlocking function for prevention of handle operation. <br> - Padlock is not supplied separately and the number of usable padlock is decided in accordance with padlock diameter. (Refer to the following table) <br> - The specifications of the applicable padlock are referred to as the following table. |
| Direct type (TFG) | $\bullet$ | $\bullet$ | - (100/125/250 AF) | $\bullet$ |
| Extended type (TFH) | - | - | - | - |

| Application | Padlock Diameter | Padlock Quantity |
| :---: | :---: | :---: |
| HIM100,250 | $6-8 \mathrm{~mm}$ | $\varnothing 6, \varnothing 7: 2 \mathrm{EA}$ <br> $\varnothing 8: 1 \mathrm{EA}$ |
| HIM400,800 | $5-7 \mathrm{~mm}$ | 3 EA |

## External Accessories

## Front Connection of Fixed Devices

Select and use the busbar according to specification of busbar and cable connected to circuit breaker.

## Insulated Bar Connection

If busbar pitch of switchgear is equal to circuit breaker, it is possible to connect the circuit breaker directly using a insulation tube. When connected to the busbar, refer to the specification chart as below. Use the insulation barrier and terminal cover where applicable.

| Application | Connection Busbar Dimensions (mm) |  |  |  | Applicable Bolt and Tightening Torque |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | A | B | C | D | Bolt Spec. | Maximum Tightening Torque (kgf xcm ) |
| HIM100 | $<7.5$ | $<17$ | $\begin{aligned} & \varnothing \geq 5.5 \\ & (\leq 50 \mathrm{~A}) \end{aligned}$ | $A+7.5$ | M5 Screw $(\leq 50 \mathrm{~A})$ | 28.5 |
|  | $<7.5$ | $<17$ | $\begin{gathered} \varnothing \geq 9 \\ (>50 \mathrm{~A}) \end{gathered}$ | $A+7.5$ | M8 Screw $\text { (> } 50 \text { A) }$ | 110 |
| HIM125 | $<7.5$ | $<20$ | $\varnothing \geq 9$ | A +7.5 | M8 Screw | 110 |
| HIM250 | $<10$ | $<27$ | $\varnothing \geq 9$ | $A+10$ | M8 Hex Socket | 110 |
| HIM400 | < 12.5 | < 30 | $\varnothing \geq 11$ | A +12.5 | M10 Hex Socket | 270 |
| HIM630, 800 | < 12.5 | $<45$ | $\theta \geq 13$ | A +12.5 | M12 Hex Socket | 470 |

## Busbar

## Straight Busbar

- Used to meet the size of the cable or standards of the switchgear. (No change of the pitch between the poles)

## Extended Busbar

- Used to extend the insulation distance. (Extension of the pitch between the poles)

| Application |  | Straight Busbar |  | Extended Busbar (Spreader) |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Type | Pole | Type | Pitch | Type | Pitch |
| HIM250 | 3 | ISSLEU0851 | 35 mm | ISSLEU0853 | 45 mm |
|  | 4 | ISSLEU0852 |  | ISSLEU0854 |  |
| HIM400 | 3 | ISSLEU0849 | 44 mm | ISSLEU0847 | 59 mm |
|  | 4 | ISSLEU0850 |  | ISSLEU0848 |  |
| HIM630 | 3 | ISSLEU0849 | 70 mm | - | - |
|  | 4 | ISSLEU0850 |  | - |  |
| HIM800 | 3 | ISSLEU0849 | 70 mm | - | - |
|  | 4 | ISSLEU0850 |  | - |  |

## DIN Rail Adaptor

This device is used for DIN rail mounting of MCCB. (HIM100 Only)

| Application |  |  | Quantity |
| :---: | :---: | :---: | :---: |
| Type | Pole | DIN Rail Adapter |  |
| HIM100 | 2 | ISSLEU0887 | 1 |
|  | 3 | ISSLEU0887 | 2 |
|  | 4 | ISSLEU0887 | 2 |

## Motor Operator

This device is used for turning ON/OFF circuit breakers from remote position. It can be applied at low-voltage automation system or emergency power system.

| Application |  | Motor Operator | Control Voltage |  |
| :---: | :---: | :---: | :---: | :---: |
| Type | Pole |  |  |  |
| HIM100 | 3, 4 | HIM 100 Motor operator | DC24 V |  |
| HIM125 | 3, 4 | HIM 125 Motor operator |  |  |
| HIM250 | 3,4 | HIM 250 Motor operator | AC/DC110 V |  |
| HIM400 | 3,4 | HIM 400 Motor operator | AC/DC240 V |  |
| HIM630, 800 | 3, 4 | HIM 800 Motor operator |  |  |

- Note
- Motor operator should be attached only when MCCB's handle is OFF.
- If not, there is possibility of burning the motor.

## Ratings

| Application | Mechanical Lifetime | Control Voltage | Operating Current | Operation Time (ms) |  | Power Consumption (W) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Technical Information

## Standard Use Environment

## Temperature De-rating

Over-current characteristics of MCCB has been set to the ambient temperature 40 degrees celsius. If the ambient temperature is less or more than 40 degrees celsius, the over-current characteristics can be changed.

If the Ambient Temperature is less than 40 Degrees Celsius
In order to ensure that circuit breaker's over-current meet the de-rating curve at the given ambient temperature, the rear current ( $\mid r$ ) should be adjusted. The temperature correction ratio for each MCCB is shown on the circuit breaker de-rating curve.

## If the Ambient Temperature is more than 40 Degrees Celsius

If the internal temperature of the MCCB is over 40 degrees, thermal damage to the insulating material inside the MCCB can occur causing the circuit breaker to trip at an early stage. When applying ambient temperatures at higher than 40 degrees celsius, you must adjust the rated current as shown in the rated current correction table below.

In (Rated Current): Circuit breaker's rating at about ambient temperature 40 C
Ir (Real Current): Circuit breaker's rating at about ambient temperature
Ir = Correction ratio (\%) x In

Rated Current De-rating Table: Standard Mounting (Fixed)

| Model | Rated Current (A) | Ambient Temperature ( ${ }^{\circ} \mathrm{C}$ ) |  |  |  |  |  |  |  |  |  |

## Altitude De-rating

It does not affect the characteristics of circuit breaker at an altitude of less than 2000 m . Characteristics of insulation and air cooling are reduced at an altitude of more than 2000 m . You should adjust rated current and rated voltage as shown in the table below at an altitude of more than 2000 m . However, this will not change the characteristics of the circuit breaker.

| Circuit Breaker | Alitude |  | 2,000 m | 3,000 m | 4,000 m | 5,000 m |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| HIM type MCCB 100-800 AF | Withstand voltage (V) |  | 3,000 | 2,500 | 2,100 | 1,800 |
|  | Insulation voltage (V) | Ui | 1,000 | 850 | 750 | 600 |
|  | Maximum operational voltage ( N ) | Ue | 690 | 590 | 520 | 460 |
|  | Average through-current (A) at the temperature of $40^{\circ} \mathrm{C}$ | $\ln x$ | 1 | 0.96 | 0.93 | 0.9 |

## Vibrations

The excessive vibration makes some troubles in the breakage of circuit breaker, the dynamic strength of failure, electric current, carrying and the safety operating characteristics, so, for choosing the circuit breaker, you need proper consideration in these environmental stress. This stress is generated by the magnetic impact of operating open and close test, vibration during transport, and the influence of adjacent equipment. Our circuit breaker is verified by test in accordance with standard of internal impulse performance.

## Vibrations Test

Vibration test is carried out in compliance to the IEC 60068-2-6 standards for vibration to ensure the level that the shipping certificate authority requests. The test verifies the resonance performance and vibration durability based on the following

## Resonance Test

You can alter the frequency as shown in the following range of sinusoidal wave to see if there is any occurrence of vibration on a specific part of MCCB.

- 5-13.2 (Hz): Displacement amplitude 1 mm
- 3.2-100(Hz): Acceleration amplitude 0.7 g

## Vibration Durability Test

A sinusoidal wave with ferequency of 30 Hz is manually created to check the operational status for 90 minutes.

- $30(\mathrm{~Hz})$ : Acceleration amplitude 0.7 g

## Technical Information

Seismic Performance and Shock Tolerance Chart

| Part |  | Seismic Performance <br> - Vertical mounting <br> - Top-down, Left-right, Front-back |
| :---: | :---: | :---: |
| Test condition | Vibration posture, Direction of impulse |  |
|  | Status of MCCB | - Non-conduction (ON or OFF status) <br> - Status where rated current has been conducted on until the temperature of MCCB becomes constant and contiuous. |
| Test result | Judgement condition | - If it is ON, it should not be OFF <br> - If it is OFF, it should not be ON <br> - No abnormal status such as damage, transformation, or annealing of nut part <br> - The characteristics of switch and trip after the test must be normal |

## Degree of Protection

By stipulating the IP degree of MCCB based on IEC 60529 standard, the IP degree is changed according to the product condition.

| Condition | Circuit Breaker | Circuit Breaker <br> + Terminal Cover | Circuit Breaker + Terminal Cover + Rotary Handle (Front Contact) | Circuit Breaker + Terminal Cover <br> + Rotary Handle (Extended) |

## Installation

## Insulation Distance

When installing a circuit breaker, safety clearances must be kept among the breakers, panels, busbars and other protection devices installed nearby. When a short circuit interruption occurs, high temperature gas occurs and the gas is expelled above the arc chambers of the circuit breaker. In order to allow the gas to be distributed and to prevent fire and arcing or short-circuit currents, safety clearances are required.

The separtion distance in the case the circuit breaker is installed sis by side.

- Using minimum separation distance ( $\mathrm{A}=0$ ), you should assemble terminal cover and phase barrier between the product.

In the case of iron panels, the distance between the upper and base side or the right and left side.

In the case of iron panels, the distance between the front and back.

In the case that the live part is exposed, the distance from the circuit breaker.

- If the distance of both conductors is less than 60 mm please insulate the charging part.

HIM Type's Minimum Insulation Distance

| Type | Minimum Clearance (mm) |  |  |  |  |  |  |  |  |  |  |  |

## Service Environment

## Storage \& Transportation

## Storage Precaution

- Do not store in an environment containing corrosive gases (ammonia, sulfur etc)
- Do not store under high humidity

- Do not store under direct sunlight

- Do not store in an environment in which dust or dirt is present

- Avoid using this product under extremely high or low temperature and store at a temperature between $-20^{\circ} \mathrm{C}$ and $+60^{\circ} \mathrm{C}$

## Transportation Precaution

- Do not drop or give shock during transportation. This can cause mal-function in the circuit breakers.
- Do not carry circuit breakers by the external wire or accessories.

- Always hold the body of the circuit BREAKERS DURING TRANSPORTATION

- Be careful of inuuries when handling SHARP METAL ACCESSORIES

- Do not drop or give shock during TRANSPORTATION

- Check the packaging condition before transportation

## Service Environment

## Installations

- Installations must be carried out by licensed worker.
- Check whether the circuit breaker is open before performing any wiring.
- Tighten the terminal bolt using the proper torque as specified in the manual when connecting the bus or wire. Loose connections may result in.
- Tighten the terminal bolt as proper torque specified in manual or catalog. If not insulated, it may cause short-circuit fault.

- Provide enough insulating space to avoid the blockage of arc gas.

Blocked arc gas vent may cause trip operation to fail.

- Do not install in an environment where hot and humid air, dust, corrosive gas, vibration and shock is present. This may cause a fire or malfunction.
- To prevent fires or malfunctions, provide appropriate measures to prevent the entry of foreign substances following installation.
- For the 4P circuit breakers, connect 3 wires and 4 poles to the neutral line.
- This product should be used with insulation barrier. Using with no insulation barrier may result in additional short-circuit fault.

## Service Environment

## Precautions for Installations

- Install circuit breakers under the following environment conditions
When installing circuit breakers, give due consideration to the environment conditions described below. Installation in inappropriate conditions may result in malfunction or fire.
- Ambient temperature: $-5^{\circ} \mathrm{C}-+40^{\circ} \mathrm{C}$
(The average temperature for 24 hours not exceed $35^{\circ} \mathrm{C}$ )
- Relative humidity: 45\%-85 \%
- Vibration \& Shock: Without excessive vibration and shock
- Altitude: Up to 2,000 m
- Without excessive water vapor, oil vapor, smoke, dust, salts and corrosive materials

- Do not block the arc vent The breaking capacity may be reduced.

- Keep away from dust, metal shaving After installations, please use protective cover when maintaining circuit.

- Do not release insulation board from circuit breakers.
The insulation performance may be reduced.

## Precautions for Connection

- Tighten the terminal bolts with proper torque specified in the manual Incomplete tightening of the terminal bolt may cause overheating. Also, excessive tightening of torque may cause damage to the terminal bolt and circuit breaker case.

- Insulate the exposed conductor Insulate the MCCB conductor by using insulation tape. If the conductor is not be insulated, it may cause additional shortcircuit fault.

- Please do not modify STUD Rear connection type, do not force STUD. Also, when connecting wire, access without modifying STUD.
- Avoid using lube in terminal bolt Lube may reduce friction of terminal bolt.

- For 4P circuit breakers, conncet 3 wires and 4 poles to the neutral line

- Please fasten conductor firmly in parallel Firmly fasten conductor to prevent electronic repulsion when a short-circuit fault occur.

## Service Environment

## Installations

## Connections to the Power Circuit

The shock electromagnetic force caused by fault current is as follows.

The Shock Electromagnetic Force Per 1 m Conductor

| Short Circuit Current [kA] <br> (Power factor) | Shock Electromagnetic Force (3 phase) |  |
| :---: | :---: | :---: |
| Distance Between Conductors 20 cm |  |  |
| $10(0.4)$ | Distance Between Conductors 10 cm | $245(25)$ |
| $18(0.3)$ | $1,863(190)$ | $932(95)$ |
| $25(0.2)$ | $4,412(450)$ | $2,206(225)$ |
| $35(0.23)$ | $8,630(880)$ | $4,315(440)$ |
| $42(0.2)$ | $12,455(1,270)$ | $6,277(635)$ |
| $50(0.2)$ | $17,652(1,800)$ | $8,826(900)$ |
| $65(0.2)$ | $29,910(3,050)$ | $14,955(1,525)$ |
| $85(0.2)$ | $51,190(5,220)$ | $25,595(2,510)$ |
| $100(0.2)$ | $70,804(7,220)$ | $35,402(3,610)$ |
| $125(0.2)$ | $110,815(11,300)$ | $55,408(5,650)$ |

- Before installation, be sure to clean on connection terminals

To prevent to increasing contact resistance, eliminate any dust, dirt or damages of any kind.

- Conductor should be connected directly
 Bolts or Nuts is not allowed between conductors.
If the conductors are not connected directly, it may result in rising temperatures and fires.
- Conductors should be connected without overlap

When connecting several conductors, the busbar should be installed on both sides.

## Inspection and Maintenance

## Initial Inspection

- Terminal parts shall be clean from dust, metal pieces and so on
- Breaker shall not have any crack or damage
- Check terminal parts. It should be tightened with specified torque
- Be sure to check the value of Ue, Icu of the breakers
- Insulance resistance should be more than $5 \mathrm{M} \Omega$

## Dielectric Test

| Main Circuit |  | Secondary and Control Circuit 1) |  |
| :---: | :---: | :---: | :---: |
| Rated Insulation Voltage [Ui] | Test Voltage | Rated Insulation Voltage [Ui] | Test Voltage |
| $\mathrm{Ui} \leq 300 \mathrm{~V}$ | $2,000 \mathrm{~V}$ for 1 min | Uis $\leq 60 \mathrm{~V}$ | $1,000 \mathrm{~V}$ for 1 min |
| $300<\mathrm{Ui} \leq 600 \mathrm{~V}$ | $2,500 \mathrm{~V}$ for 1 min | $60 \mathrm{~V}<$ Uis $\leq 600 \mathrm{~V}$ | $2 \cdot$ Uis $1,000 \mathrm{~V}$ (Minimum $1,500 \mathrm{~V}$ for 1 min |

-     - Dielectric strength tests should be done in these conditions.

1) Between terminals and earth

## Service Environment

## Periodic Inspection

In order to maintain the breaker performance and prevent accidents, periodical inspection shall be conducted after installation and operation.

## Standard of Inspection

| Standard | Circumstance | Inspection Cycle after Installation |
| :---: | :---: | :---: |
| Normal | Clean air, no humidity | Within 10 years: Once 2-3 year |
|  |  | More than 10 years: Once a year |
|  |  | More than 15 years: Once 6 month |
|  | Dust but no corrosive gas | Within 10 years: Once 1 year |
|  |  | More than 10 years: Once 6 month |
|  |  | More than 15 years: Once a year |
| Bad | Sulfurous gas, salinity, vapor | Within 5 years: Once 6 month |
|  |  | More than 5 years: Once a year |
|  | Excessive corrosive gas | Once a month |

## Periodic Check Point

| Item of Inspection | Procedure | Trouble Shooting |
| :---: | :---: | :---: |
| Tightening terminal torque | -Tightening torque on terminals | - Applying the tightening torque indicated in manual Too strong tightening torque may cause damage |
| Dust and dirt | -Confirm to breaker's body and upper side of the line part. Be sure to clean in term of dust and dirt to secure insulation | - Remove the debris with a clean tool |
| Case | -Check for damaged and cracked on breakers | - Replace with a new breaker |
| Arc exhaust part | -Check terminal part for arc exhaust. | - Replace with a new breaker in case you can find the black soot and melted metal parts on the breakers |
| Operation | Manually put On and OFF several times in case of holding close position. <br> It makes reduce friction which is made from harden grease and stabilize contact resistance | - Replace with a new breaker in case of malfunction on ON and OFF <br> - Replace with a new breaker in case of exceeding mechanical and electrical durability |
| Terminal discoloration | -Check for discolored terminal and conductor parts -Be sure to confirm insulation capability on conductor parts | - There in no problem with lightly discolored silver coating part. In case breakers have an insulation trouble caused by heat, replace with a new breaker |
| Insulation resistance | Measure insulation resistance between each poles, terminal and earth | - Insulation resistance should be more than $5 \mathrm{M} \Omega$. If lower than $5 \mathrm{M} \Omega$, replace with new one |

## Inspection and Trouble Shooting After Breaking Current

- If there is no pollution in arc exhaust parts and no other abnormality, the breaker can be re-used.
- Measure the insulation resistance when carbonizing symptom is found around arc exhaust parts. If the resistance value is more than $5 \mathrm{M} \Omega$ with no dielectric breakdown at withstand test voltage and no excessive temperature rise of terminal parts, the breaker can be re-used.
- If the handle part is carbonized or there is metallic melting in internal of breaker, please replace it with a new one.

## Maintenance

## Trouble Shooting

In case of any abnormality during breaker operation, please refer it as below. The following table lists a series of typical service conditions, to help you understand and solve hypothetical faults or malfunctions.

| Problem | Symptom | Possible Cause | Trouble Shooting |
| :---: | :---: | :---: | :---: |
| Overheating | High temperature of terminal part | - Loose connection between terminal and conductor | Mounting screw with proper torque |
|  |  | - Increaed resistance between terminal and conductor | Replace with a new breaker |
|  | Damage in insulation part of terminal | - Loose connection between terminal and conductor | Replace with a new breaker |
|  |  | - Loose connection on terminal parts caused by interference with foreign substance |  |
|  | High temperature of breaker body | - Increased contact resistance | Replace with a new breaker |
|  |  | - Loose internal assembly screws |  |
|  |  | - Increase of current density from cable disconnection |  |
| Overheating | Abnormal voltage of load side | - Excessive contact abrasion | Replace with a new breaker |
|  |  | - Foreign substances on contact |  |
|  |  | - Melt down on conducting bar (Corrosion of conductor by excessive ON-OFF or corrosive gas) |  |
| Inability of ON, OFF, and RESET | Inability of ON | - Inability of reset after trip | On after RESET |
|  |  | - Damaged trip mechanical parts due to lots of operation and improper frequency | Replace with a new breaker |
|  |  | - Non-energized UVT | Input operational control voltage |
|  | Inability of OFF | - Melted and adhered contact tip | Replace with a new breaker |
|  | Inability of RESET | - Non-energized UVT | Input operational control voltage |
|  |  | - Not enough cooling on bi-metal | Cool down ambient temperature, then Reset |
|  |  | - Corruption and deformation of bi-metal | Replace with a new breaker |
|  |  | - Malfunction of mechanical parts |  |
|  |  | - Run out of excessive ON-OFF |  |
|  |  | - Damaged mechanical parts after trip on over-breaking capacity |  |
| Frequent trip | Trip at under rated current | - High ambient temperature (Higher than 40) | Cool down ambient temperature by ventilation or others |
|  |  | - Heating by loose terminal screw connection | Tighten screws with specified torque |
|  |  | - Heating from inside of breaker | Replace with a new breaker |
|  |  | - Connection conductor of which cross-section area is smaller than specified size | Use the specified size of conductor or adjust the rated current |
|  | Trip at operational current | - Trip at start-up inrush current | Adjust the instantaneous trip setting or replace with a higher rated current breaker |
|  |  | - Trip at change-over in star-delta operation |  |
|  |  | - Instantaneous trip at reverse feeding |  |
|  |  | - Instantaneous trip at high inrush current | Replace with a higher rated current breaker |
|  |  | - Instantaneous trip at long starting current |  |
|  |  | - Short-circuit due to motor malfunction <br> - Fault of connecting with SHU or UVT | Repair or replace with new motors and check wiring cables |
| Non trip | Non trip at the current higher than specified | - Low coordination with primary protect device or miss-selected with other protect device | Reconsider of coordination |
|  |  | - Unconsidered ambient temperature | Confirm the derating current |
|  |  | - Improper rated current | Confirm rated current |
| Malfunction of Accessory | Malfunction of SHT | - Over and under control voltage | Confirm rated voltage |
|  |  | - Drop of the control voltage | Keep control |
|  |  | - Incorrect coil voltage, damaged coil caused by non operating of switch in order to prevent malfuntioning | Replace with new parts |
|  | Malfunction of UVT | - Malfunction of mechanism part | Replace with new parts |
|  |  | - Incorrect coil voltage | Confirm control voltage |
|  |  | - Burned UVT controller of the coil | Replace or check for wiring |
|  | Malfunction of AUX and ALT | - Damaged contact caused by excessive rated operational current | Replace or check for operational current |
|  |  | - Malfunction of mechanism part | Replace or repair |

Load Line range of Moulded Case Circuit Breakers are designed and manufactured to world-class standards. Loadline series MCCBs provide overload and short-circuit protection for all applications. The thermal \& magnetic elements, adjustable over a wide band, make these MCCBs ideal for any distribution application.

## Features:

- Wide range : 16 A to 1600 A (AC)
- Compact dimensions
- Adjustable thermal setting (70-100\%) In
- Adjustable magnetic setting (5-10 times / 4-10 times) $\mathrm{I}_{\mathrm{n}}$.
- Suitable for use as switch disconnector
- In 4P WSN version, neutral makes first and breaks last
- Push to trip button provision
- Uniform front escutcheon plate
- Positive dolly position indication
- Suitable for DC application upto 1600 A
- Separate main and arcing contacts
- Wide range of accessories

[^1]
## Range :

16 A to 1600 A in 7 frame sizes in single pole,
double pole, three pole and four pole with switched neutral execution.

## Specification :

Conforms to IS / IEC: 60947-2

## MCCB

Moulded Case Circuit Breaker

Loadline Moulded Case Circuit Breakers have precision formed moulded case and cover of high performance resin bonded thermoset material. The circuit breakers are designed to allow grouping in distribution panels or switchboards to present their operating handles and label escutcheons uniformly aligned in a single panel cut out.

The switching mechanism is Quick make-Quick break type and is tripfree, i.e. the breaker trips internally even if the operating knob is held in ON position.

The contact mechanism comprises of fixed and moving contacts made of sintered silver alloy for reliability, long life and anti-welding properties. Arcing contacts are provided in higher frames, further increasing the contact life.

The arc extinguishing device comprises of arc chutes having grid plates mounted in parallel between supports of insulating material. The arc is divided between these grid plates which helps in its fast quenching. The arc is thus confined, divided and extinguished in the arc chute. The excellent insulation between the conducting parts and better energy dissipiation after short circuit makes it possible to make the load and line connections on either side.

The tripping mechanism comprises of a bimetal and heater element for overload protection and fixed \& moving core for magnetic protection in each pole coupled to a single trip bar unit to avoid single phasing. The overload and magnetic setting are front adjustable on site.

## Thermal Magnetic Type

The overload protection is provided by a combination of the heater element and the bimetal strip in each phase which activates the trip mechanism.

Short Circuit protection is provided by the magnetic circuit comprising of the fixed and moving core. In the event of short circuit, the moving core is attracted towards the fixed core due to the high electromagnetic forces developed which actuates the trip mechanism.

The fixed and moving contacts of Loadline MCCBs are so designed that an electromagnetic repulsive force is developed under high currents which is sufficient to overcome the spring tension holding the moving contacts, thereby initiating the contact opening resulting into faster opening of the contacts limiting the prospective short circuit current.

Note: Phase barriers \& extended terminals supplied with MCCB as standard, • Available
Havells new A frame MCCBs with adjustable thermal and magnetic release are designed and manuafactured to world class standard in accordance to IS / IEC 60947-2 Standard. The user friendly MCCBs provide accurate and reliable protection against overload and short circuit.

Current Rating: 80 A - 250 A
Execution: 3 pole \& 4 pole with switched netural
Breaking Capacity: 16 kA, 25 kA \& 35 kA

- Compact size and light weight
- Adjustable thermal and magnetic release
- Precise and reliable overload and short circuit protection

Loadline DC MCCBs
DC MCCBs are available in three pole version from $25 \mathrm{~A}-1600 \mathrm{~A}$ with breaking capacity of $5 \mathrm{kA}, 10 \mathrm{kA} \& 20 \mathrm{kA}$. The selection of the circuit breaker for DC applications depends on these criteria

- Rated current of the equipment. - Rated voltage, which determines the number of poles in series for breaking. For voltages upto 250 Vdc, two poles of the breaker are connected
in series to form the positive pole and the third pole to be used as a negative pole or three poles can be used in series. - The maximum short-circuit current at the point of
installation, which determines the breaking capacity. The (L/R) ratio for the application should be $\leq 15 \mathrm{~ms} \bullet$ In D Frame Rear Terminals are available in place of Back Studs

| $380-440$ Vac | IHLUVRD440 |

The breaker trips if the supply voltage dips below $70 \%$ to $35 \%$ of the rated voltage.
The breaker cannot be switched ON unless there is a supply to the UVR. (NVNC feature).
Supplied with external mounting Power pack to operate on AC
supplies. Additional transformer is supplied with LUVRD440 \&
LUVRD110.

## Earth Fault Relay

The Earth Fault Relay is a common accessory for use in conjuction with all MCCB frames.

The Earth Fault detection system for use with Loadline MCCBs comprises of a core balance transformer (CT) coupled to an advanced RCD relay. The relay may be used to trip a circuit breaker via a shunt trip or an under voltage release in the event of an Earth Fault.

The relay and one of the four available CT's is all that is required for a complete earth fault sensing system suitable for the control of a circuit breaker in a circuit upto 800 A fitted with either a shunt trip or an under voltage release. The simple arrangement and a small number of interconnections necessary ensure that EFR is easily selected and installed.

The relay is suitable for 220-240 Vac supply with the flexibility of choosing the sensitivity between 300 mA to 1 A and time delay in the range of 200 mili second - 5 second The required sensitivity and time delay should be selected by the dip switches provided on the facia of the relay.

## Features

- No nuisance tripping
- DIN rail mounting
- Adjustable time delay
- Choice of sensitivity from 300 mA upto 1A
- Trip indication LED (Red)
- ON indication LED (Green)
- Test push button
- Reset push button

Technical Information

| Supply Voltage | $220 / 240 \mathrm{Vac}, 50 / 60 \mathrm{~Hz}$ |
| :--- | :---: |
| Changeover contact | $5 \mathrm{~A} \mathrm{AC}-15250 \mathrm{~V}$ |
| Sensitivity | $300 \mathrm{~mA}, 500 \mathrm{~mA}, 1 \mathrm{~A}, \mathrm{NT}$ |
| Time delay (ms) | $200,500,1000,5000$ |

Note: Option to By-Pass EFR in NT position available with dip switch.

## Core Balanced Current Transformer

| Size | Current Rating | Dimension | Shape |
| :---: | :---: | :---: | :---: |
| 1. | $25-100 \mathrm{~A}$ | 60 mm | Circular |
| 2. | $125-200 \mathrm{~A}$ | 95 mm | Circular |
| 3. | $250-400 \mathrm{~A}$ | 145 mm | Circular |
| 4. | $500-800 \mathrm{~A}$ | $300 \times 80 \mathrm{~mm}$ | Rectangular |

| Earth Fault Relay |  |
| :--- | :---: |
| MCCB Current Rating (A) | Cat. No. |
| $25-100$ | IHEF1100 |
| $125-200$ | IHEF2200 |
| $250-400$ | IHEF3400 |
| $500-800$ | IHEF4800 |

The earth fault relay is supplied with the CT based on the current rating. To operate the EFR, a shunt trip or an under voltage release is necessary which has to be ordered seperately.

## Dimensions (in mm)

Enclosures made of special grade CRCA steel are available for housing G, A and C Frame MCCBs upto 800A. They are manufactured with latest technology using CNC Punch and Brake presses to attain highest degree of perfection. The enclosures are painted with latest techniques in powder coating using epoxy polyester and polyester resin based powder paints to ensure smooth, scratch resistant surface coatings. They are suitable for wall mounting \& adequate knockouts are provided for cable entry.

## Transformer Protection

## Primary side

For the protection of transformer with a circuit breaker connected to the primary side (LT primary) the no load inrush current of the transformer must be considered. The peak value of the first current wave often reaches 10-15 times the rated current and may sometimes reach as high as 20-25 times. However, the transient decays very quickly (in a few m.sec.). Thus the MCCB selected should have a magnetic setting which will not be actuated by the momentary inrush current.

## Secondary side

Loadline MCCBs can be used for protection of transformer on the LT side (secondary side) as an outgoing protective device.
The rated current of the transformer is calculated as follows :

$$
I_{e}=\frac{k V A \times 1000}{\sqrt{3 \times U_{e}}} A
$$

' $U_{e}$ ' is the Rated Voltage at the LT side
The Breaking capacity of the breaker for protection can be calculated as :

$$
I_{b}=\frac{I_{e}}{Z \%} \times 10^{-3} \text { Kiloamperes }
$$

Where ' $I_{b}$ ' is the rated breaking capacity,
' ${ }^{\mathrm{b}}$ ' ' the rated current
' $Z \%$ ' is the percentage impedance of transformer (specified by the manufacturer)

## Selection table For Transformer Protection

| 750 |  |  |  |  |  |  |  |  |  |  |

## Generator Set Protection

Loadline MCCBs can be used for the effective protection and control of Diesel Generating set against overload and short circuits.

The Current rating of MCCB to be selected is calculated as follows :

$$
\begin{aligned}
\mathrm{kVA}= & \sqrt{ } 3 \mathrm{U}_{\mathrm{e}} X \mathrm{I}_{\mathrm{e}} \\
& \text { or } \\
\mathrm{I}_{\mathrm{e}} & =\frac{\mathrm{kVA}}{\sqrt{3 \times U_{e}}}
\end{aligned}
$$

Where,
kVA = Rating of the DG Set
$U_{e}=$ Rated Voltage
$I_{\mathrm{e}}=$ Rated Current
The MCCB rating selected is greater than or equal to the rated current value

## Selection \& Application

## Feeder / Cable Protection

An estimation of the prospective short-circuit current (psc) in an installation is an important consideration in the selection of the appropriate protective device.
The magnitude of the short-circuit current (rms value of the AC component) at a point in the installation will depend upon;
(A) Prospective short-circuit current at the origin of the installation.
(B) The amount of resistance in the circuit between the origin of the installation and the point at which the short circuit occurs.
(C) The type of short-circuit, phase to phase or phase to earth or phase to neutral.

It is possible to arrive at a maximum prospective short circuit value at the origin by taking the transformer kVA rating and its impedance and calculating from the expression :

SC kA= $\qquad$
To calculate the resistance in the LV circuit, obtain details of lengths and sizes of cables between the source of supply and the point under calculation. Using the table provided, determine the sum of cable resistances and then simply read off the estimated fault current from the relevant transformer curve on the graph.

The values assume a symmetrical fault across the three phases. In a single circuit, for line to neutral faults, take the cable resistance value from the table and double it.

The selection of Loadline MCCB for feeder /cable protection depends on the total load to be protected and the prospective short-circuit current (psc) at the point of installation.

| PSC at A | approximately 27 kA |
| :--- | :--- |
| PSC at B <br> resistance A to B (a) | $0.30 \mathrm{~m} \Omega=25 \mathrm{kA}$ |
| PSC at C |  |
| +resistance A to B | $0.30 \mathrm{~m} \Omega$ |
| +resistance B to C1 | $10.70 \mathrm{~m} \Omega$ |
|  | $11.00 \mathrm{~m} \Omega=12 \mathrm{kA}$ |
| PSC at D |  |
| +resistance A to B | $0.30 \mathrm{~m} \Omega$ |
| +resistance B to C | $10.70 \mathrm{~m} \Omega$ |
| +resistance C to D | $46.00 \mathrm{~m} \Omega$ (b) |
|  | $57.00 \mathrm{~m} \Omega=3 \mathrm{kA}$ |

(a) 2 cables per phase divided by 2
(b) 2 core cable, multiplied by 2

The above calculations have an inbuilt safety margin as they assume a no impedance fault condition which would not be the case in practice.

## Selection \& Application

## Motor Control

Loadline MCCBs can be used for motor protection. Selection of MCCBs has to be done taking into consideration the starting inrush current, and the system fault levels. Further the selection is also based on type of starting, i.e. DOL or Star Delta.

## DOL Starting

Care is to be taken to avoid nuisance tripping during starting of Squirrel Cage Motors since the inrush current will be in the order of 600 to $800 \%$ of the full load current of the motor. The overload setting is chosen such that it does not trip during starting

## Star-Delta Starting

In Star Delta starting of motors, since there is a reduction in the starting current due to reduced voltage, the MCCBs do not have a problem in the overload setting. But the transient currents can go upto 12 times the rated current during change over from star to delta which will cause the instantaneous magnetic release to trip the breaker. So proper selection of magnetic pickup level is important for prevention of nuisance tripping during change over from Star to Delta.

It is always recommended to select an MCCB in co-ordination with Contactor and Over Load Relay so as to have the best and optimum benefit of all the devices.

Direct online 7 X full load current for 5 seconds.
Star/Delta 4 X full load current for 12 seconds.

## Selection \& Application

## Capacitor Control

When a capacitor circuit is opened, it exhibits characteristics distinctly

differently from inductor loads due to the effects of residual electric charge in the capacitor. The recovery voltage appears across the contacts immediately after the circuit is opened is equal to the difference between the capacitor residual voltage and supply voltage. Therefore half a cycle after the circuit opens, the voltage between the contacts of the switch rises to twice the supply voltage or higher.

In a three phase circuit the recovery voltage appearing between the contacts in the first interrupted phase could rise to as high as 2.5 times the supply voltage. Unless the breaker contacts are fully open for at least $1 / 2$ cycle after the capacitor current is interrupted, restrike of arc is likely to occur. If the restrike arc is repeated, the voltage could continue to rise to the dielectric breakdown point of the capacitor. Hence, fast interrupting, quick make, quick-break circuit breakers should be used for this type of circuit.
When a capacitor circuit is closed a condenser charge $q=C U$ which corresponds to the instantaneous value ' $U$ ' of the supply voltage at closing time, must be instantaneously supplied, causing a large inrush current to flow through it. If the capacitor circuit is closed in the voltage phase at which the inrush current is maximum, the maximum value of the inrush current is approximately,

$$
I_{p}=\frac{C}{L} \times U
$$

The maximum time duration during which the maximum current flows is about 0.5 ms . Selection of a MCCB for capacitor circuit duty must therefore consider the effects of higher short circuit and inrush currents. This will affect the choice of instantaneous trip current rating. In practice, an MCCB which satisfies the following equations should be chosen.

$$
\begin{aligned}
& I_{r}>1.5 \times I_{c} \\
& I_{\text {inst }}>\frac{I_{p}}{2}
\end{aligned}
$$

Where :

[^2]It is therefore necessary to select a circuit breaker with current rating not less than 1.5-2.0 times the rated current of the capacitor.

## Dc Control

MCCBs though not separately designed for DC applications are suitably modified to be able to operate on DC systems also upto 500 Vdc / 250 Vdc. This is achieved by modifying for:
i) Current carrying capacity
ii) Over current and short circuit protection
iii) Short circuit breaking capacity (with L/R time constant limitations)

## Current Carrying Capacity

The continuous current carrying capacity is generally a function limited by the temperature rise of various internal components of MCCBs.
The AC rating of MCCBs is expressed as "RMS" value. The DC rating is "Average" value. The RMS and average value can be related by a "Form Factor" which is 1.1.
Hence, an AC MCCB can be assigned a 10\% higher DC current rating. But in practice the use of DC MCCB ratings are equal to AC ratings and thereby, temperature rise is restricted within limits.

## Overload Release \& Overload Protection

The overload release are generally thermal type with a BimetalHeater system. The heating effect which can be expressed by the factor integral $I^{2} t$ varies for AC and DC. The integral $\left(1^{2} t\right)$ for AC will be 1.21 times integral ( ${ }^{2}$ avt) for DC, thus an AC MCCB when used in DC circuit will trip slower. For example a 100 A AC MCCB when used in DC circuit for 100A will sense a $20 \%$ overload only from 133A onwards.
To retain the same Overload characteristics as AC, it is important to separately calibrate the MCCBs for DC ratings and overload tripping characteristics need to be suitably modified.

## Short Circuit Release \& Short Circuit Protection

The short circuit release is actuated by the peak value of the AC sine wave. Since no such peak exists in DC, DC tripping will be slower. Hence to achieve the same short circuit pick up level in DC, the short circuit release will be calibrated specially.

## Short Circuit Breaking Capacity

In AC the breaking of the short circuit current usually occurs within the first current zero, by the current limiting effect. No such current zero exists in DC. Arc breaking and ultimate quenching of arc depends on the rapid dissipation of the inductive Energy $1 / 2 \mathrm{Li}^{2}$

This energy dissipation is dependent on $L / R$ or time constant of the circuit. The L/R values should be limited to $10-15$ milli seconds to achieve satisfactory performance. This is achieved usually by splitting the DC arc voltage over 2 or 3 poles by connecting them in series, depending upon on the DC voltage.

Havells New HID Series (Frame 1) Moulded Case Circuit Breaker is designed and manufactured to world class standard, keeping in mind the complex requirement of electrical system of present and future ensuring reliability which can give uninterrupted service through out product life, meeting all the stresses that the system encounters.
HID Series (Frame 1) MCCBs use the U-shaped Fixed Contact design and Slot Motor Concept along with the unique Enclosed Arc chute Design to provide excellent performance and safety. Besides being compact, it offers ease of installation and termination, extended life, making it an extremely user friendly range of Moulded Case Circuit Breaker for any application.
In fact HID Series (Frame 1) MCCB is a perfect blend of aesthetics, features and performance.
The HID Series (Frame 1) covers a range of 40 A to 160 A in 27 kA \& 36 kA breaking capacity with lCu=les=100\% and fully complies with National and International standarcls. These MCCBs along with the high level of breaking capacity are thermal adjustable making it compatible for various load requirements to meet varied application needs in distribution networks.

## Range:

- Rating: 40 A to 160 A
- Execution: 1P, 2P, 3P \& 4P
- Breaking Capacity: 27 kA \& 36 kA
- Ics = Icu = 100\%
- Thermal Adjustable (70 to 100\% of $I_{n}$ )

Ref. Standard:
IS / IEC : 60947-1 \& 2

## Construction

## Case \& Cover:

New HID Series (Frame 1) Moulded Case Circuit Breakers have precision formed molded case and cover of high performance resin bonded thermoplastic material. The circuit breakers are designed to allow grouping in distribution panels or switchboards to present their operating handles and label escutcheons uniformly aligned in a single panel cut out.

## Switching Mechanism:

It is Quick make-Quick break type and is trip-free, i.e. the breaker trips internally even if the operating knob is held in ON position.

## Contact mechanism:

It comprises of fixed and moving contacts made of sintered silver alloy for reliability, long life and anti-welding properties.

The U-shaped Fixed Contact design utilizes the electromagnetic repulsive force between the arms of the " U -type" conductor to achieve faster opening of the contacts based on the concept that two current carrying conductors when placed parallel to each other will repel each other.

It also uses the Slot Motor Concept meaning when high current flows through the contacts the magnetic field is produced which drives the contacts apart. The magnetic field intensity has been increased through the presence of high permeability material which in turn increases the force on the moving contact arm resulting in faster opening of the contacts.

## Enclosed Arc Chute:

Arc chute Design is of unique enclosed type to rapidly deionize the medium between contacts as soon as the current becomes zero so that the rising contact voltage or restriking voltage cannot breakdown the space between contacts. This is achieved by increasing the pressure in the vicinity of the arc, due to which the density of the particles constituting the discharge also increases. The increased density of particles causes higher rate of de-ionization and consequently the dielectric strength of the medium between contacts is increased.

## Tripping Mechanism:

It is thermal magnetic type to handle both overload and short-circuit fault currents.

The overload protection is provided by a combination of the heater element and the bimetal strip in each phase which activates the trip mechanism. The overload setting is front adjustable on site.

Short Circuit protection is provided by the magnetic circuit comprising of the fixed and moving core. In the event of short circuit, the moving core is attracted towards the fixed core due to the high electromagnetic forces developed which actuates the trip mechanism.

## Accessories

Extended Terminals

## Accessories Ordering Information

## Shunt Trip

- It is used for remote tripping of circuit breaker
- Shunt trip coil is rated for short time duty

## Auxiliary Switch

- It is used for ON and OFF position indication and control
- In normal ON / OFF operation it operates simultaneously with main contacts
- 1NO-1NC - Field Fitted
- 2NO - 2NC - Factory Fitted

## Alarm Switch

- It operates only when the breaker trips

Digital range microprocessor based electronic MCCBs are designed and manufactured to world-class standards. These MCCBs provide high level of breaking capabilities and offer close, accurate and reliable protection against overload, short-circuit and ground fault through multiple adjustment options. The user-friendly breaker comes with a wide range of internal/external accessories.

## Features:

- True RMS sensing-accurate and close protection.
- High repeat accuracy-reliable protection.
- Flexibility through multiple adjustment option-versatility and closer protection.
- Time delay on overload and short-circuit faults-suitable for discrimination.
- Built in adjustable electronic overload sensing (40\% to 110\% of In).
- Built in adjustable short-circuit current sensing (600\% to 1000\% of Ir.)
- No external power required for basic functioning of the release.
- Built in operation-check function with Field Testing Provision.
- Accurate setting by use of DIP switches, ensuring reliable system protection/co-ordination.

## Range :

25 A, 40 A, 63 A, 100 A, 125 A, 160 A, 200 A, 250 A, 400 A \& 630 A in three pole and four pole execution.

## Specification :

Conforms to
IEC : 60947-2 / IS: 13947-2 EMI/EMC
IEC : 61000-4-2 (ESD Test)
IEC : 61000-4-3 (Radiated Electromagnetic Field Test)
IEC : 61000-4-4 (EFT Test)
IEC : 61000-4-5 (Surge Test)
IEC : 61000-4-6 (Conducted
Disturbances Test)

Construction

Loadline Digital Moulded Case Circuit Breakers have precision formed moulded case and cover of high performance resin bonded thermoset material. The circuit breakers are designed to allow grouping in distribution panels or switchboards top resent their operating handles and label escutcheons uniformly aligned in a single panel cutout.

The switching mechanism is Quick make-Quickbreak type and is trip free, i.e. the breaker trips internally even if the operating knob is held in ON position.

The contact mechanism comprises of fixed and moving contacts made of sintered silver alloy for reliability, long life and anti-welding properties. Arcing contacts are provided in higher frames, further increasing the contact life.

The arc extinguishing device comprises of arc chutes having grid plates mounted in parallel between supports of insulating material. The arc is divided between these grid plates which helps in its fast
quenching. The arc is thus confined, divided and extinguished in the arc chute. The excellent insulation between the conducting parts and better energy dissipation after short circuit makes it possible to make the load and line connections on either side

The tripping mechanism comprises of magnet holder trigger which is coupled to the single trip bar unit to avoid single phasing. The electronic circuit gives a signal to this unit in case of over current fault and this unit further trips the MCCB.

Over current protection The sensing of the current is through the current transformers fitted on the main terminals. In the case of any fault the secondary output of the CT increases. This secondary output of CT goes to the micro controller based electronic circuit. The micro controller is programmed to give a signal as per inverse time characteristics. The signal in the form of DC supply is given to magnet holder trigger which trips the MCCB. The tripping time and tripping current can be set with the help of the DIP switches provided on the front panel of the MCCB.

## - Available

LSI - Long Delay, Short Delay \& Instantaneous
LSIG - Long Delay, Short Delay, Instantaneous \& Ground Fault
3 P-Three Pole
4 P wSN - Four Pole with Switched Neutral

## FEN / FEH Frame Accessories

(Accessories are for 3P / 4P)

| Voltage | Rating | Configuration | Cat. No. |
| :--- | :---: | :---: | :---: |
| $125 / 250 \mathrm{Vac}$ | 1A | 1 NO + NC | IHLLALF1CO |

| Voltage | Rating |
| :---: | :---: |
| 100-110 Vac | IHLLSTF110 |
| $220-240$ Vac | IHLLSTF240 |
| $380-415 \mathrm{Vac}$ | IHLLSTF415 |

Note: Shunt Trip releases is provided with built-in auxiliary contact

| Voltage | Rating |
| :---: | :---: |
| $110-120$ Vac | IHLUVRF110 |
| $220-240$ Vac | IHLUVRF240 |
| $380-440$ Vac | IHLUVRF440 |

The breaker trips if the supply voltage dips below 70\%-35\% of the rated voltage.
The breaker cannot be switched ON unless there is a supply to the UVR. (NVNC feature).
Supplied with external mounting Power pack to operate on AC supplies. Additional transformer is supplied with LUVRF440 \& LUVRF110.

MOUNTING \& DOOR CUT OUT DETAILS

Havells introduces a new range of MCCB Panel boards for Electrical supplies from 250 A - 630 A. In addition to managing safe Electrical Distribution, the range reflects the wider peripheral demands within modern Commercial buildings installations and upgrades, addressing application requirements such as metering. With an ever increasing focus on energy management and monitoring, the MCCB Panel boards have been designed to simplify the installation of metering for both incoming and outgoing supplies. Outgoing MCCB's for current ratings up to 160 A are available for Panel boards up to 400 A. The 630 A Panel boards provide options for outgoing circuits up to 250 A .
This range is available in double door version. It also has a provision to install a changeover switch as an Incomer.

## Features:

- Available in Single door and Double door with aesthetic layout
- Door opening to $180^{\circ}$ for easy access
- Robust 1.6 mm gland plates are removable to aid installation
- Rigid \& weld free construction to reduce distortion
- Removable door with easy align hinge to aid installation
- Chrome plated hinges
- Door barrel lock accessory for increased security
- Powder coated paint for better environment protection
- Cable holder provision in cable alley
- Key hole mounting
- Ingress protection, IP-30 for single door and double door

## Range :

Two basic versions :

- 'G' frame panel boards upto 400 A
- 'A' frame panel boards upto 630 A

## Specification :

- Fully application oriented as per
- IS / IEC: 60947-I\&II
- IS / IEC: 61439-3
- IS / IEC: 60529

## Internal Configuration

*Available in both Single Door and Double Door

## Basic Module

This accommodates single MCCBs up to 400 A in G frame panel boards and up to 630 A in A Frame panel boards. They are all supplied with their own dedicated set of preformed copper interconnections. It has provision for $2,4,6,8,12 \& 16$ way outgoing circuits suitable for mounting single pole, or three pole or four pole 'G' Frame MCCBs up to 160 A in ' $G$ ' frame panel boards and for mounting three pole ' $A$ ' frame MCCBs up to 250 A in ' $A$ ' frame panel boards. The bus bar system are fully rated and are completely shielded all around by nylon robust shrouds having proper air vents. Adequate space is provided for terminating the cable onto the MCCBs.

## Cable Way Module

Cableway can be added on either side of the basic module for termination of incoming \& outgoing MCCBs. The cable way selection is simply determined by adding together the modular height of the final layout \& choosing cableways to match. The vertical insulated partition kit allows shielding between the shared face of a cableway and the basic module.

## Metering Module

This module can be assembled on top of the basic module. Two types of metering module are available, namely, analog and digital. The analog type metering module comprises of analog type ammeter and voltmeter, whereas, the digital type metering module comprises of digital type ammeter and voltmeter. Besides ammeter and voltmeter, the metering module is provided with selector switches, indicating lights and back up fuses.

## MCB Module

A module for housing MCBs can be integrated with the panel board for individual final outgoing circuit protection. Two different versions are available for mounting 22 SPMCBs or 24 SPMCBs on DIN channel.

## Add on Module

The add on module is designed for giving extra space for incoming termination. This module can be assembled at the bottom of the basic module if required.

## Add on Changeover switch module

This module houses the changeover switch for main / standby supply integration. It is available in $250 \mathrm{~A}, 400 \mathrm{~A}$ and 630 A .

## Add on ATS module

This module houses the AUTOMATIC TRANSFER switch for main / standby supply integration. It is available in $250 \mathrm{~A}, 400 \mathrm{~A}$ and 630 A .

"Titania" range of Air Circuit Breakers are available from 630 A to 2500 A rating in 3 Pole and 4 pole execution, with breaking capacity of 50 kA to 75 kA . These ACBs have been designed keeping in mind the present day complex requirement of electrical systems which makes it essential to have a reliable product which can give un-interrupted service through out the product life meeting all the stresses that the system encounters..

## Features:

- Compact size, wide range \& high breaking capacity
- 630 A to 2500 A available in only 2 frame sizes
- First frame available upto 2000 A
- Common height, depth and panel door cutout
- Plug in type front accessible accessories
- Accessories are field fittable \& common for the entire range
- Modular construction for pole unit
- Easily replaceable arcing contacts.
- Available with communication facility
$\mathrm{C}^{3}$ technology
630 A to 2500 A in 2 frame sizes with 3 \& 4 Pole execution

Air Circuit Breaker

## Construction

Operating Mechanism is of stored energy type, which operates using pre-charged springs. The springs are charged manually with the help of charging handle or with the help of charging motor, if provided. The same operating mechanism is used for the entire range. Mechanism has been developed using less number of parts resulting in more reliability, longer mechanical life and requiring very less maintenance.

## Contact Mechanism

Conductor Unit is of modular design. Each pole consists of Main and Arcing contacts which are housed in the moulded housing The contacts are made from sintered silver alloy for reliability, longer life and anti-weld properties. The construction of the contact is such that arcing contact closes before and opens later than the main contact, this substantially reduces erosion of main contact under normal and short circuit conditions.

The current transformer is placed inside the pole unit around the lower terminal.
Arc Chutes are provided for quenching the arc. Arc chute comprises of grid plates mounted in parallel in the insulated housing. The arc is divided between these grid plates which helps in its fast quenching. The arc is thus confined, divided and extinguished in the arc chute. The excellent insulation between the conducting parts and better energy dissipation after short circuit makes it possible to make the load and line connections on either side.

The Tripping Mechanism comprises of magnet holder trigger which is linked to the trip bar unit. The electronic circuit gives a signal to this unit in case of over current fault and this unit mechanically trips the Circuit Breaker.

In Over Current Protection the sensing of the current is through the current transformers fitted on the main terminals. In case of any fault the secondary output of the CT increases. This secondary output of CT goes to the micro controller based electronic circuit. The micro controller is programmed to give a signal as per inverse time characteristics. The signal in the form of DC supply is given to magnet holder trigger which trips the ACB. The required tripping time and tripping current can be set with the help of the switches provided on the front panel of the electronic release.

## New Intelligent Protection Releases

New Intelligent Protection Releases - Plus (IPR +) are the multifunctional dedicated protection units for ACB, using advanced microcontroller with full benefits of microprocessor technology offering overload \& short circuit protection functions, advance protection functions, measurement \& advanced monitoring functions, LCD display, MODBUS communication etc.

For meeting all the application requirements, ACBs come with a wide variety of new electronic releases, categorized into 6 different categories as IPR E+, IPR 1+, IPR 2+, IPR 3+, IPR 4+ and IPR $5+$. IPR 1+ being the base model and IPR E+ as the economical version. The next four new models IPR 2+, IPR 3+, IPR 4+ and IPR $5+$ are of premium segment with High-end Features.

Features (IPR E + \& IPR 1+):

- Self powered by built in Current Transformer
- User friendly settings of current and time delay using Rotary Switches
- For IPR E+ : Adjustable LTD \& INST settings (Economical Version)
- For IPR 1+ : Adjustable LTD, STD, INST \& GFT settings
- Both Three Phase and Earth fault protection in same unit (IPR 1+)
- More Reliable and repetitive accuracy, using high end micro-controller
- True RMS sensing with immunity to system disturbances
- Compatible with both 5P10 \& 5P10 CTs
- LED Indication for fault discrimination
- Function blocking facility provided
- Compact Size \& light weight
- Elegant Aesthetics

| Ref. | Description | Ref. | Description |
| :--- | :--- | :--- | :--- |
| 1 | Rotary switch for setting LTD current | 10 | Rotary switch for setting GFT time |
| 2 | Rotary switch for setting LTD Time | 11 | LED indication for GFT fault |
| 3 | LED indication for LTD fault | 12 | Product identification code |
| 4 | Rotary switch for setting STD current | 13 | LED for "Power ON" |
| 5 | Rotary switch for setting STD time | 14 | Reset push button |
| 6 | LED indication for STD fault | 15 | Test push button |
| 7 | Rotary switch for setting INST current | 16 | Socket for test supply |
| 8 | LED indication for INST fault | 17 | LED for "Test ON" |
| 9 | Rotary switch for setting GFT current | 18 | Time current characterstics curve |

## New Intelligent Protection Releases

Features (IPR2+, IPR3+, IPR4+ and IPR5+):

- Advanced Protection Functions
- In-built Measurement Module
- Wide LCD Display
- Zone Selective Interlocking
- Making Current Release Function
- Thermal Memory
- *Ready To Close Feature
- $I^{2 r}$ ON/OFF Feature
- Contact Erosion Indicator
- Bar Graphs for Current \& Voltage
- Fault History on Display
- Circuit Breaker Failure Function
- Downstream CB Fail Feature
- Digital Operation Counter
- LED Annunciations on Front Fascia
- RS-485 MODBUS Communication facility

| Ref. | Description | Ref. | Description |
| :--- | :--- | :--- | :--- |
| 1 | LCD Screen | 12 | Enter / Save Push Button |
| 2 | LED for "Power ON" | 13 | Test Push Button |
| 3 | LED for "IPR Fit" | 14 | Reset Push Button |
| 4 | "LED for "RTC (Ready to Close)" | 15 | Back Push Button |
| 5 | LED for "Test ON" | 16 | Time Current Characterstic Curvev |
| 6 | LED for "PTA (Pre-Trip Alarm)" | 17 | LED Indication for LTD Fault |
| 7 | LED for "Faults" | 18 | LED Indication for STD Fault |
| 8 | Scroll "Left" Push Button | 19 | LED Indication for INST Fault |
| 9 | Scroll "Up" Push Button | 20 | LED Indication for GFT Fault |
| 10 | Scroll "Right" Push Button | 21 | Product Identification Code |
| 11 | Scroll "Down" Push Button | 22 | MODBUS RS-485 Communication Port |

[^3]
## IPR+ Specification

- Overload function (LTD)

LTD Current
LTD Time
OFF, $40 \%$ to $100 \%$ of $I_{\text {CT }}$ 0.5 s to 30 s

- Short Circuit function (STD)

STD Current
STD Time
OFF, $100 \%$ to $1000 \%$ of $\mathrm{I}_{\text {ст }}$ 50 ms to 600 ms

- Instantaneous function (INST)

INST Current
OFF, $200 \%$ to $1600 \%$ of $I_{\text {CT }}$

- Ground fault function (GFT)

GFT Current
GFT Time
OFF, $10 \%$ to $100 \%$ of $\mathrm{I}_{\text {CT }}$ 50 ms to 1000 ms

## Time current Characteristics

NOTE: All above values are with a tolerance of $\pm 20 \%$
NOTE: It should be noted that the reference current for this release is $\mathrm{I}_{\mathrm{ct}}$ or $\mathrm{I}_{\mathrm{n}}$ (i.e. rated current of the CT) mounted in the circuit breaker and not the $I_{r}$ (the rated current of the circuit breaker).

## Description of Features (IPR 2+, 3+, 4+ \& 5+)

## Advanced Protection Module:

Along with the basic protection functions of Overload, Short Circuit, Instantaneous and Earth Fault Protection, Intelligent Protection Releases (IPR 2+, 3+ and 5+) offer the advanced protection against the following:

- Over Voltage
- Under Voltage
- Over Frequency
- Under Frequency
- Unbalanced Voltage
- Phase Sequence Protection

## In-built Measurement Module:

It measures the below system parameters on real time basis:

- Current (Both in 3 phases \& neutral)
- 3 phase voltage
- Ambient temperature
- Apparent Power (kVA)
- Real Power (kW)
- Reactive Power (kVAr)
- Power Factor

These parameters can be directly viewed on the LCD screen of the Intelligent Protection Release only. Also, a data monitoring sheet can be generated and exported as an excel file for analysis purpose.

## Zone Selective Interlocking:

In the presence of two protection devices against overcurrent in series, the load side protection device carries out the protection without making the other device trip irrespective of the level of the fault current.
When the current increases the threshold values as per the settings done, each protection device sends a block signal by means of a direct connection to the upstream breaker and checks that a similar lock signal has not arrived from the downstream breaker. In this way only the protection nearest to the fault intervenes irrespective of the level of the fault current. In case, if the breaker doesn't trip within the pre-defined trip time, then the Breaker Fail feature of the IPR comes into action and it initiates the tripping of the upstream breaker.

## MCR (Making Current Release) Function:

In case, if initially the Breaker is in the open condition and the fault is already present in the system. Now, when the Breaker is closed, a fault current flows through it. In this situation, the MCR function by-passes the STD time delay and trips the Breaker Instantaneously if the making current exceed a value pre-determined by the customer. Once the Breaker is closed on to a normal circuit condition, this MCR gets inoperative.

## Thermal Memory:

Thermal memory protects the distribution system from cumulative overheating caused by repeated overcurrent conditions.
With this feature the release remembers recent overcurrent events that may have initiated the trip timing sequence, and then returned to nominal levels, halting the sequence prior to trip initiation. In the event that the current levels again exceed the pickup set point within a few cycles of the original pickup, the unit's memory recalls the previous near trip and automatically imposes a shorter delay time. In effect, the unit treats multiple time-related events as a single continuous event thereby preventing system damage due to cumulative overheating. Also, in the event that current levels cause the breaker to trip and the breaker is immediately reclosed, the trip unit remembers the previous overcurrent trip and again imposes a shorter delay time should an additional overcurrent occur before a sufficient cool down period has elapsed.
In case, if the control supply (from incoming or external source) of the Release is interrupted, then too the Release retains its memory \& remembers the previous overcurrent trip \& functions accordingly. This is called the No Power Thermal Memory (NPTM) feature.

## Contact Erosion Indicator:

It indicates the erosion (in percentage) of the Arcing contacts occurred during its service condition. This can be view on the screen. And it does not merely indicate the contact erosion percentage, but if it is above $90 \%$, then it will suggest the user to replace the arcing contacts through a message 'Service Contacts' on the screen.

## Relay Contact Card:

It provides 8 potential-free ( $\mathrm{NO} / \mathrm{NC}$ ) contacts for the remote indication of various LEDs on releases' front fascia and various types of faults. Also, these are programmable and can be set by the customer as per the requirement. This is an optional feature provided on request.
${ }^{12} \mathrm{t}$ ON / OFF Feature:
To offer precise co-ordination with large variety of electrical loads, the Intelligent Protection Release comes with Selectable I2t ON/ OFF curve feature for short-circuits. Making it OFF will set the definite time characteristics meaning tripping at definite time (as per the set STD Time) after the fault current crosses the threshold value (set STD Current). And selecting it as ON, will set the inverse time characteristics between the trip time and the fault current during short circuit conditions.

## Fault History:

It records, stores the data of the last 100 fault events. This data can be exported as excel file through MODBUS Communication and the data of last 10 faults can be directly viewed on the LCD screen of the Intelligent Protection Release only. This data includes the type of fault with date and time stamping along with the current, voltage and frequency values of the system during that fault.

## Ready To Close:

By this feature, the Intelligent Protection Release checks for whether the ACB is ready to close or not and indicates the same to the user through LED on the front fascia of the Release. This is an optional feature provided on the request of customer. This LED glows only if all the below conditions are fulfilled:

1. D/O Contacts are Intact
2. Charging spring is charged
3. Breaker is in Open condition
4. Fault LED is not glowing (means, if the fault occurred in last operation and the fault LED glowed, then the reset button has been pressed)
5. IPR is fit to work (IPR Fit LED is glowing)

## IPR E+

IPR 1+

IPR 2+

## Circuit Breaker Fail Protection:

In case if the breaker doesn't open within its defined time as per the setting done by the user, due to any reason (including even any mechanical failure also). The Release checks for it and immediately initiates the trip command to its upstream breaker.

## Down CB Fail:

If a breaker receives this command from its downstream breaker (in case of the failure of the downstream breaker) or through an external source (as in case of emergency), then the breaker immediately trips to protect from encountering any hazardous situation.

## Wide LCD Display with Bar Graphs:

The Intelligent Protection Releases (IPR 2+, IPR 3+, IPR 4+ and IPR 5+) comes with a wide $70 \mathrm{~mm} \times 40 \mathrm{~mm}$ Graphics Display for the ease of readout of the parameters. The bar graphs for current and voltages of each phases ( $\mathrm{R}, \mathrm{Y}$ \& B ) and Neutral displays a relative data at a glance and offers a prompt visual check of the status of the system. All the running parameters of the system can be viewed in the auto scrolling mode also. The "ACB Status" indication can be viewed on display (only) if RTC feature is requested.

## IPR Fit Indication:

It continuously monitors its own electronic circuit and the corresponding IPR Fit LED glows continuously in its healthy condition. And when any internal fault occurs, the Release trips the breaker and shows a message 'IPR Not Fit' on the display with the 'IPR Fit' LED turned OFF.

## LED Indications:

The Release has two sets of LED indications on its front fascia.
First set on its right side indicates that the tripping has occurred due to which type of basic four faults as below:

1. LTD- Overload Tripping
2. STD- Short Circuit Tripping
3. INST- Instantaneous Tripping
4. GFT- Ground Fault Tripping

Second set is present below the LCD display:

1. Power- Power 'ON' LED
2. IPR Fit- IPR Fit function
3. *RTC- Ready To Close
4. Test- Test Mode
5. PTA- Pre-Trip Alarm
6. Fault- Fault Indication

## Digital Operation Counter:

The Intelligent Protection Release counts the number of ON-OFF operations both with \& without current, stores it in its memory and displays the same on the screen.

## IPR 3+

IPR 4+

IPR 5+

[^4]
## MODBUS Communication Module

The top premium version, the IPR 5+ offers RS-485 MODBUS communication facility which makes it ready for all the smart city applications. It enables the user to monitor the entire system from his control room on a PC/Laptop, to control/modify the setting of the Release as per the user requirement, record and export the data of complete fault history and system parameters for analysis operate the breaker from the PC/Laptop only.

It is recommended to connect 12-24 Vdc external suppply with IPR5+ for taking the maximum benefit of its features. Also, to perform the closing operation on ACB through MODBUS communication facility, the "closing coil" and "charging motor" accessories are mandatory.

The software required for this system is also offered by Havells on request which enables the user to:

- Connect several ACBs through the laptop/PC
- View the status of LED's on IPR+'s front fascia
- Bar graphs for current and voltage parameters
- View metering data and import it to the system
- View parameter settings (both of base \& advanced protection)
- Edit all these settings and restore them to default settings
- View information of contacts (operation Counter \& Contact Erosion)
- *View ACB’s status (ON, OFF, Spring Charge, D/O contacts Intact)
- Operate the ACB (close, open, self-test function)
- Change password \& adjust clock etc.

*This feature can be viewed on display (only) if RTC feature is requested

*Provided on request. \#Communication software provided on requrest.
Note: IPR+ releases do not require any extenrnal power supply for their basic protection functioning. For other functions and display to run, they require an external power supply of 12-24 Vdc.

## Accessories

## Electrical Accessories:

## Charging Motor:

It is provided in an electrical operated ACB to charge the closing springs automatically. These are available in 110 V and 220 Vac / DC. The VA burden of this motor is 150 VA only and the charging time is 3 to 4 seconds.

Drawout Accessories:

## Position Indication Switch:

A set of 5 micro switches is provided in the cradle which indicates the position of breaker in the cradle i.e. CONNECTED, TEST, or DISCONNECTED position. Two switches each are provided for CONNECTED AND DISCONNECTED position and one switch is for TEST position.
These coils are used for electrical tripping and closing of ACB. These coils are available in $24 \mathrm{~V}, 110 \mathrm{Vac} / \mathrm{DC}, 220 \mathrm{Vac} / \mathrm{DC}$ \& 415 Vac . The same coil can be used as a shunt trip coil or closing coil. The inrush power is 200 VA.

## Shunt Trip Coil / Closing Coil:

These coils are used for electrical tripping and closing of ACB.These coils are available in $24 \mathrm{~V}, 110 \mathrm{Vac} /$ DC, 220 Vac / DC \& 415 Vac. The same coil can be used as a shunt trip coil or closing coil. The inrush power is 200 VA .

## Undervoltage release:

This release trips the ACB in case the voltage drops below the required level. It is necessary to energise the under voltage release coil before attempting to close the circuit breaker as in de-energized condition, it mechanically locks the breaker and the same can not be closed. These coils are available in 24 Vdc, 110 Vac / DC, 220 Vac / DC \& 415 Vac .
For energizing this coil minimum $85 \%$ of the rated voltage is required and if the voltage drops below $50 \%$ of the rated voltage it automatically trips the ACB. Inrush power of this coil is 200 VA and the continuous power is 5 VA only.

## Adaptor terminals for Cradle:

Special Adaptor Terminals can also be provided for Ist frame ACB which can make the terminals suitable for taking horizontal as well as vertical bus bar connections. The standard cradles are supplied with horizontal terminals. Adaptor terminals are factory fitted and are available at extra cost.

## Mal-insertion prevention device:

It prevents the breaker of a different rating being inserted into the cradle of different rating.

## Accessories

Other Accessories:

## Other Accessories:

Trip Indication Switch:
It is provided to get a remote signal indicating that ACB has tripped due to the operation of over current release.

## Order Form

Please check $\begin{aligned} & \\ & \text { in front of appropriate box. Fill separate sheet for each type of ACB }\end{aligned}$

Note :

1. Please specify the voltages for closing coil, shunt trip coil and UVT, available voltages are $24 \mathrm{VDC}, 110 \mathrm{VAC} / \mathrm{DC}, 220 \mathrm{VAC/DC}$ and 415 V AC and for motor available voltages are 220V AC/DC and 110V AC/DC.
2. For details of Intelligent Protection Release (IPR+), please refer the chart of technical features
*3. Communication Software on Chargeble basis.

With experience of around 25 years offering solutions to various industrial applications under "Make in India" initiative, Havells presents a completely new GLOBAL series of Controlgear for Power distribution and Protection.
The range includes Contactors , Over-Load Relays and up to 800A along with complete range of accessories \& Timer ( ON / OFF Delay) in compact \& robust design complying with relevant Indian \& International Standards (IEC /IS: 60947-4-1). This State of the Art product with cutting edge technology ensures High Performance in harsh conditions.
A wide range of accessories offers selection flexibility to meet the essential requirements of most stringent industrial applications including Starting, Inching \& Plugging of LT Motors.

## Features:

- Dust Free Cover
- Low Power Dissipation / Coil Consumption
- High Endurance / Switching Frequency
- Class-H Insulation for Coils
- Nut Retaining Washer
- Inbuilt Aux. Contacts
- CE Marking
- Gold Design Certification
- Lloyd "7S" - Classifications
- Terminal Barrier \& Shrouds up to 800 A
- Removable Arc Chutes (> 115 A ratings)

## Thermal Overload Relays HGST 9-800 AF

Havells New Urja motor starter are designed to meet the stringent requirements of both agricultural as well as domestic applications. The basic function of starter is isolation, motor control, protection against short circuit, overload \& single phasing. These starters address the customer needs to the fullest by incorporating the New Havells Contactors and Relays accompanied with the best after sales service and an unparalleled distribution network across India.

## Features:

- Reliability: Thermal bimetallic relay provides protection against overload and single phasing Preventor gives protection against Single Phasing.
- Selectivity: Wide band operating Voltage 200 V-400 V and 260 V-440 Vac.
- Robust Construction: Heavy Duty Contactor capable of working under severe conditions.
- Easy to Check: Manual Trip Facility is provided to check the trip operation.
- Flexible Design: Flexibility of onsite conversion between Automatic / Manual reset

## Range :

- Direct on line starters (0.75 HP - 15 HP ) $0.6 \mathrm{~kW}-11.2 \mathrm{~kW}$
- Direct On Line Submersible Pump controller (1 HP - 15 HP ) $0.7 \mathrm{~kW}-11.2 \mathrm{~kW}$
- Automatic Star Delta Submersible Pump controller (5 HP - 25 HP) $3.7 \mathrm{~kW}-18.7 \mathrm{~kW}$
- Single Phase pump controller ( $0.5 \mathrm{HP}-3 \mathrm{HP}$ ) 0.6 kW - 0.37 kW

## Specification :

Conforms to IS / IEC: 60947-4-1

## Urja Motor Starter

## URJA - DOL Agri Pump Motor Starter

The starter incorporates robust four pole contactor \& thermal overload relay provided in a smart \& sleek powder coated deep drawn enclosure to suit the rugged Indian rural conditions for complete protection to pump \& motor.

## URJA - Single Phase Submersible Pump controller

Havells New Urja Single Phase Submersible Pump Controller is designed to meet the stringent requirements of both agricultural as well as domestic applications. The basic function of starter is isolation, motor control and protection against overload. These have been engineered to offer long, reliable life with minimum maintenance.

## Direct On Line Submbersible Pump Controller

DOL starter consists of contactor, overload relay, ON/OFF push buttons, housed in a sheet steel enclosure. It is meant for starting/stopping a motor and protects the motor against overload and single phasing condition.

## Automatic Star Delta Submersible Pump Controller

In the beginning the star \& main contactors get switched ON and the pump runs in star position. After the preset star time, the auto changeover to delta takes place and thereafter the starter runs in delta position. Star delta starters help in meeting the starting current requirement during the star operation and the running current requirement during the delta operation of the submersible pump motor. The changeover from star to delta is achieved by means of an electronic timer which can be adjusted from 1 to 30 seconds as per the requirement of the motor. The Standard Model, offers protection against overload and single phasing, the Deluxe Model offers additional protection against short circuit besides overload and single phasing.

## Features:

- Reliability: Thermal bimetallic relay provides protection against overload and single phasing Preventor gives protection against Single Phasing.
- Selectivity: Wide band operating Voltage $200 \mathrm{~V}-400 \mathrm{~V}$ and 260 Vac - 440 Vac.
- Robust Construction: Heavy Duty Contactor capable of working under severe conditions.
- Easy to Check: Manual Trip Facility is provided to check the trip operation.
- Flexible Design: Flexibility of onsite conversion between Automatic / Manual reset
- Better Safety for motor and Operator: Provision of MCB gives added protection against short circuit in ASD Deluxe Model.
- Repeat accuracy: Electronic Timer is provided to precisely control the changeover from Star to Delta. The changeover time can be set accurately from 1 to 30 seconds as per the motor requirement.
- Added Safety from flash-over: A pause time has been provided between Star to Delta changeover to allow proper quenching of arc. The pause timing is available from 30 ms to 150 ms
- Option for Extended Protection: In case of momentary interruption in power supply the water in the pipe flows backwards into the ground. Sudden restoration of power supply during this period causes excessive load and may even result into burning of the motor. To prevent this, starters can be made available with the option of protection of a built-in on-delay in the SPP unit. Further, this delay can be provided optional as one minute or five minutes.
- Dual Mode Operation: Starter is provided with two modes of operation through a selector switch as follows:
a. 'Auto' mode with single-phasing preventor in circuit starts automatically
b. In 'Manual' mode the starter needs to be initialized manually through start button

Note: The on-delay in Single Phasing Preventor unit comes into effect only in auto mode.

## Contactor

The new 'Urja' series of Contactor are designed and manufactured to world class standard.
The series covers contactor range $20 \mathrm{~A}-40 \mathrm{~A}$ in 2 Pole \& 4 pole execution. These conform to IS /IEC : 60947-4-1 \& IEC 60947-4-1.
The contactor provides reliable and safe switching \& thermal overload relay offers close and accurate protection against overload and single phasing.

The user friendly series comes with a range of add on optional accessories to meet varied application needs in motor and distribution circuits.

## Contactor Features

- Compact and rugged construction
- Encapulated coil
- High mechanical \& electrical endurance
- Suitable for low voltage conditions
- Liberal Terminal capacity
- Spare coil and contact kit available

## Contactor Accessories

Urja Contactor 2P / 4P (Spares)

## Thermal Overload Relay

## Principle of Operation

The heating elements in the main circuit heat the bimetal tripping elements corresponding to the motor load current. The heating elements are calibrated such that the set trip point is achieved in accordance with the standards. By means of trip bar, the movement / deflection of the bimetal is transmitted to plunger which in turn operates the trip mechanism and thus the contacts are separated. The trip point can be easily set on a scale in accordance with the nominal motor rated current.
Bimetal elements for compensating the trip point in case of different ambient temperature is fitted on the trip lever. Buttons are used for testing the circuit to be protected, for resetting by hand and for conversion from manual to auto reset mode.

## Differential Mechanism

The relay operates on the differential system of protection provided by the double slide mechanism. Under single phasing conditions, the two slides of the relay undergo differential deflection. One slide senses the movement of the bimetal that deflects the maximum, while the other senses the minimum deflection.
The slides are linked in such a way that the difference in movements of the two slides is amplified for actuation of the trip lever. This leads to accelerated tripping under single phasing.

Dimension in (mm)

Smart Street Lighting allows a city to easily schedule lights ON or OFF for individual or group of lights so that the city can intelligently provide the right level of lighting needed by time of day, season, or weather condilitions.
Introducing Havells Street Light Panel that is specially designed for energy conservation in conventional street light systems.
Apart from energy saving, it also saves on Manpower, Operating Cost and reduces Manual Operating Errors.

## Features:

- Timer based system: Allows one to set the ON and OFF time. The switching of street lights can be repeated every day as per the set time through Programmable 24 Hours Time Switch / Programmable Astronomical Time Switch
- Mode Selection: By Auto/ Manual Selector switch
- Panel Locking Facility: Provision of Door locking by Padlock and Panel lock
- Installation: Wall mounted / Floor Mounted
- Enclosure: CRCA Sheet Steel duly phosphatized and power coated
- Degree of Protection: IP 54 (Dust \& Vermin proof)

## Range :

- Three Phase (230 Vac / per phase application) version in two frame sizes - Max. Load 6 kW \& 12 kW
- Single Phase (230 Vac) version in single frame size - Max. Load $2 \mathrm{~kW}, 4 \mathrm{~kW}, 6 \mathrm{~kW}$ \& 12 kW

## Specification:

IS 8623 / IEC 60439
IS 2147 / IEC 60529

## Street Light Panel

## Introduction

Smart Street Lighting allows a city to easily schedule lights ON or OFF for individual or group of lights so that the city can intelligently provide the right level of lighting needed by time of day, season, or weather conditions.

Introducing Havells Street Light Panel that is specially designed for energy conservation in conventional street light systems. Apart from energy saving, it also saves on Manpower, Operating Cost and reduces Manual Operating Errors.

## Reference Standard:

- IS 8623 and IEC 60439
- IS 2147 and IEC 60529

## Range

- Three Phase ( $230 \mathrm{Vac} /$ per phase application) version in two frame sizes - Max. Load 6 kW \& 12 kW
- Single Phase (230 Vac) version in four frame size - Max. Load $2 \mathrm{~kW}, 4 \mathrm{~kW}, 6 \mathrm{~kW}$ \& 12 kW

## Features

- Timer based system: Allows one to set the ON and OFF time. The switching of street lights can be repeated every day as per the set time through Programmable 24 Hours Time Switch / Programmable Astronomical Time Switch

24 Hour Programmable Time Switch has a 24 Hour dial and is used to switch an electrical circuit "ON" or "OFF" at selected times during a period of time programmed in advance. A program consists of a closing time and an opening time for a circuit.

Astronomical Programmable Time Switch automatically adjusts the set time along with seasonal variation to control ON / OFF for lighting on purpose of realizing that light is turned ON when sun sets \& turned OFF when sun rises. This time switch is programmed on latitude base for whole year for sun rise and sun set timing.

- Mode Selection: By Auto/ Manual Selector switch
- Panel Locking Facility: Door locking by Panel lock and provision for Pad Locking available
- Installation: Wall mounted / Floor mounted
- Enclosure: CRCA Sheet Steel duly phosphatized and powder coated with 7 tank process
- Degree of Protection: IP 54
- Pre-wired ready to use
- Liberal termination space
- Louvers provided on both sides for proper heat dissipation
- Manufactured by an ISO 9001 certified company

## Product Description

| Technical Specifications |  |
| :--- | :---: |
| Operating Voltage | $220 \mathrm{Vac}-240 \mathrm{Vac}$ |
| Power Consumption | Approx. 9 W at 252 Vac |
| Operation Period | 1 Week |
| Max. Switching Current | 16 A |
| Weekly Program | Total 50 ON steps and 50 OFF steps |
| Minimum Setting Unit | 1 second |
| Clock | $12-\mathrm{h} \mathrm{(am/pm)} \mathrm{and} \mathrm{24-h} \mathrm{selection}$ |
| Mounting | DIN Rail |
| Dimensions | $60 \mathrm{~mm} * 35 \mathrm{~mm}$ * 90 mm |
| Weight | 105 g |
| Type of protection | IP 20 |

## Operation Functions

| Functions | Description |
| :---: | :---: |
| Adjusting Clock | Allow current date \& time settings through day, hour (24-hour/ 12-hour indication), minutes and seconds settings |
| Weekly Timer Operation | Controls the output according to set time of ON \& OFF for specified days of the week |
| Holiday Setting | Sets holidays without having to revise the bexisting program. (16 Dates max.) |
| Permanent Override ON / OFF | Alows the output to be forcibly turned ON/ OFF regardless of the control ouput setting. |
| Keypad Lock | Allows each key to lock/ unlock. When key is locked programming parameters of that key can not be edited. |
| Programmable No. of Steps | Allows to modify No. of steps per program. (6 minimum, 25 maximum) |
| Enable / Disable Program | Allows to enable/ disable particular program. |

## Other Settings of Timer

| Step | Function |  | Dey |
| :--- | :--- | :--- | :--- |
| 1 | For Permanent Override ON | Press 'ESC' for 3 second | Permanent Override ON displays |
| 2 | For Permanent Override OFF | Press 'ESC' for 3 second | Permanent Override OFF displays |
| 3 | For Auto Mode | Press 'ESC' for 3 second | Auto Mode Displays |
| 4 | For Lock All Keys | Press 'ENT' for 3 times | Lock 'L' displays |
| 5 | For Unlock All Keys | Press 'ENT' for 3 times | Lock 'L' stop displaying on screen |
| 6 | To End | Press 'ENT' | Current Time displays on screen |
| 7 | To Reset | Press 'RST' for 3 second | Device reset to factory setting |

## To Set Date \& Time

| Step | Function | Key | Display |
| :---: | :---: | :---: | :---: |
| 1 | To set the Present Date | Press © Key | Date Bit Blinks |
| 2 | To select the Present Date | Press '^ ' or 'v' Key | Date Bit Increases or Decreases |
| 3 | To save the Present Date \& set the Present Month | press 'PRG' key | Month Bit Blinks |
| 4 | To select the Present Month | Press ' $\wedge$ ' or 'v' Key | Month Bit Increases or Decreases |
| 5 | To save the Present Month \& set the Present Year | press 'PRG' key | Year Bit Blinks |
| 6 | To select the Present Year | Press '^ ' or 'v' Key | Year Bit Increases or Decreases |
| 7 | To save the date \& to set current time | Press 'ENT' Key | Hour Bit Blinks |

| 9 | To save the Present Hour \& set the Present Minute | press 'PRG' key | Minute Bit Blinks |
| 10 | To select the Present Minute | Press '^' or 'v' Key | Minute Bit Increases or Decreases |
| 11 | To save the Present Minute \& set the Present Second | press 'PRG' key | Second Bit Blinks |
| 12 | To select the Present Second | Press '^ ' or 'v' Key | Second Bit Increases or Decreases |
| 13 | To save the time \& to set current day | Press 'ENT' Key | Day Bit Blinks |
| 14 | To select the present Day | press 'PRG' key | Day Bit moving left |
| 15 | To save the day \& to set clock | Press 'ENT' Key | Clock Bit Blinks |
| 16 | To set the Clock type | Press '^ ' or 'v' Key | Clock Bit Displays 24 Hour or 12 Hour |
| 17 | To save the Clock type \& to end | Press 'ENT' Key | current time is shown in display |

## Technical Information

Programming for ON / OFF Time

| Step | Function | Key | Display |
| :--- | :--- | :---: | :---: |
| 1 | To begin the setting | Press 'PRG' key | Program Number Bit Blinks |
| 2 | To select the Program Number | Press ' $\wedge$ ' or 'v' Key | Program Number Bit Increases or <br> Decreases |
| 3 | To save the Program Number \& to set On/ Off of day | Press 'ENT' Key | Day Bit Blinks |
| 4 | To select the day | Press 'PRG' key | Day Bit moving left |
| 5 | To select the setting of that day | Press ' $\wedge$ ' or 'v' Key | Setting will change to ON / OFF |
| 6 | To save the Day setting \& to set the step No. | Press 'ENT' Key | Step No. Bit Blinks |
| 7 | To select the Step No. | Press ' $\wedge$ ' or 'v' Key | Step Number Bit Increases or Decreases |
| 8 | To save the Step No. \& Set the ON time of the step | Press 'ENT' Key | ON time Bit Blinks |
| 9 | To select the ON time of the step | Press ' $\wedge$ ' or 'v' Key | ON time Bit Increases or Decreases |
| 10 | To save the Step ON time \& Set the OFF time of the <br> step | Press 'ENT' Key | OFF time Bit Blinks |
| 11 | To select the OFF time of the step | Press ' $\wedge '^{\prime}$ or 'v' Key | OFF time Bit Increases or Decreases |
| 12 | To Save the Step OFF time | Press 'ENT' Key | Next Step Bit Blinks |
| 13 | To set the Next Step | Repeat Step 6-12 |  |
| 14 | To End | Press 'ESC' Key | Current time is shown in display |

Programming for Holiday Setting

| Step | Function | Key | Display |
| :---: | :---: | :---: | :---: |
| 1 | To begin the setting | Press 'SET/^' key | Step Number Bit Blinks |
| 2 | To select the Step Number | Press '^ ' or 'v' Key | Step No. Bit Increases or Decreases |
| 3 | To save the Step No. \& to set the Program No. | Press 'ENT' Key | Program No. Bit Blinks |
| 4 | To select the Program Number | Press '^' or 'v' Key | Program No. Bit Increases or Decreases |
| 5 | To save the Program No. \& to set the Holiday No. | Press 'ENT' Key | Holiday No. Bit Blinks |
| 6 | To select the No. of Holidays | Press '^ ' or 'v' Key | Holiday No. Bit Increases or Decreases |
| 7 | To save the Holiday No. \& to set the Holiday date | Press 'ENT' Key | Holiday date Bit Blinks |
| 8 | To select the Holiday Date | Press '^ ' or 'v' Key | Holiday Date Bit Increases or Decreases |
| 9 | To save the Holiday Date \& to set the next Holiday date | Press 'ENT' Key | Next Holiday date Bit Blinks |
| 10 | Repeat the steps to set all holiday dates and then to end | Press 'ENT' Key | Version is shown in display |
| 11 | To End | Press 'ENT' Key | Current time is shown in display |
| 12 | To set current Holiday Date | Press © Key | Holiday Date Bit Blinks |
| 13 | To select the Date | Press '^' or 'v' Key | Holiday Date Bit Increases or Decreases |
| 14 | To Save the Date \& to set the time | Press 'ENT' Key | Current time is shown in display |
| 15 | To select the time | Press '^ ' or 'v' Key | Time Bit Increases or Decreases |
| 16 | To save the Time \& to set the day of week | Press 'ENT' Key | Day Bit blinks |
| 17 | To select the day | Press 'PRG' Key | Day Bit moves left |
| 18 | To save the day and set the clock type | Press 'ENT' Key | Clock Bit blinks |
| 19 | To select the clock type | Press '^' or 'v' Key | Clock type bit increses or decreases |
| 20 | To save the clock type \& to end | Press 'ENT' Key | Current time is shown in display |

Note: At any time, to come out from the programming, press 'ESC' Key.

| :---: | :---: |
| Adjusting Clock | Allow current date \& time settings through day, hour (24-hour/ 12-hour indication), minutes and seconds settings |
| Setting Latitude, Longitude \& Timezone | "Allows user to set Latitude \& Longitude of his location \& timezone as per UDT standards first digit as; <br> Latitude: 0 for North \& - for South <br> Longitude: 0 for East \& - for West" |
| Summer/ winter Daylight Shift | Allows user to select Daylight shift due to Summer \& Winter |
| Sunrise \& Sunset Timings (Twilight Settings) | "Allows user to view prsent day's Sunrise \& Sunset timings \& to give offset in those timings if required <br> Offset Range: -59 to +59 minutes Shows on Display; <br> POS: for +ve offset (add minutes) <br> NEG: for -ve offset (subtracts minutes)" |
| Day of Week Operation | Allows user to select on which day of week to operate Astro-Time Switch Function. |
| Permanent Override ON / OFF | Alows the output to be forcibly turned ON/ OFF regardless of the control ouput setting. |
| Keypad Lock | Allows each key to lock/ unlock. When key is locked programming parameters of that key can not be edited. |

## To Set Date \& Time

| Step | Function | Key | Display |
| :---: | :---: | :---: | :---: |
| 1 | To set the Present Date | Press © Key | Date Bit Blinks |
| 2 | To select the Present Date | Press '^ ' or 'v' Key | Date Bit Increases or Decreases |
| 3 | To save the Present Date \& set the Present Month | press 'PRG' key | Month Bit Blinks |
| 4 | To select the Present Month | Press '^ ' or 'v' Key | Month Bit Increases or Decreases |
| 5 | To save the Present Month \& set the Present Year | press 'PRG' key | Year Bit Blinks |
| 6 | To select the Present Year | Press '^ ' or 'v' Key | Year Bit Increases or Decreases |
| 7 | To save the date \& to set current time | Press 'ENT' Key | Hour Bit Blinks |
| 8 | To select the Present Hour | Press '^ ' or 'v' Key | Hour Bit Increases or Decreases |
| 9 | To save the Present Hour \& set the Present Minute | press 'PRG' key | Minute Bit Blinks |
| 10 | To select the Present Minute | Press '^ ' or 'v' Key | Minute Bit Increases or Decreases |
| 11 | To save the Present Minute \& set the Present Second | press 'PRG' key | Second Bit Blinks |
| 12 | To select the Present Second | Press '^ ' or 'v' Key | Second Bit Increases or Decreases |
| 13 | To save the time \& to set current day | Press 'ENT' Key | Day Bit Blinks |
| 14 | To select the present Day | press 'PRG' key | Day Bit moving left |
| 15 | To save the day \& to set clock | Press 'ENT' Key | Clock Bit Blinks |
| 16 | To set the Clock type | Press '^ ' or 'v' Key | Clock Bit Displays 24 Hr or 12 Hr |
| 17 | To save the Clock type \& to end | Press 'ENT' Key | current time is shown in display |

## To Set Latitude \& Longitude

| Step | Function | Key | Display |
| :--- | :--- | :---: | :---: |
| 1 | To begin | Press 'PRG' Key | Latitude Bit Blinks |
| 2 | To select the Latitude | Press ' $\wedge$ ' or 'V' Key | Latitude Bit Increases or decreases |
| 3 | To save the Latitude \& to set Longitude | Press 'ENT' Key | Longitude bit Blinks |
| 4 | To Select the Longitude | Press ' $\wedge$ ' or 'V' Key | Longitude Bit Increases or decreases |
| 5 | To save the Longitude \& to set Timezone | Press 'ENT' Key | Timezone Bit Blinks |
| 6 | To select the Timezone | Press ' $\wedge$ ' or 'V' Key | Timezone Bit Increases or decreases |
| 7 | To save the Timezone \& to set Daylight Shift | Press 'ENT' Key | SW Bit Blinks |
| 8 | To select the Daylight Shift | Press ' $\wedge$ ' or 'V' Key | SW Bit Increases or decreases |
| 9 | To save the Daylight Shift \& to set Week Day | Press 'ENT' Key | Week Day Bit Blinks |
| 10 | To select the Week Day | Press 'PRG' Key | Week Day Bit moves Left |
| 11 | To Save the Week Day \& to end | Press 'ENT' Key | current time displays on screen |

## To Set Sunrise \& Sunset

| Step | Function | Key | Display |
| :---: | :---: | :---: | :---: |
| 1 | To begin | Press '^' Key | Sunrise Bit Blinks |
| 2 | To select the Sunrise Time | Press '^ ' or 'v' Key | Sunrise Bit Increases or Decreases |
| 3 | To save the Sunrise Time \& to Set Sunset Time | Press 'ENT' Key | Sunset Bit Blinks |
| 4 | To select the Sunset Time | Press '^ ' or 'v' Key | Sunset Bit Increases or Decreases |
| 5 | To save the Sunset Time \& to set Offset Sunrise | Press 'ENT' Key | Offset Sunrise Bit Blinks |
| 6 | To change the Offset Sunrise Type (positive/ negative) | Press '^' or 'v' Key | Offset Sunrise Type changes |
| 7 | To save the Offset Sunrise \& to set Offset Sunset | Press 'ENT' Key | Offset Sunset Bit blinks |
| 8 | To change the Offset Sunset Type (positive/ negative) | Press ' $\wedge$ ' or 'v' Key | Offset Sunset Type Changes |
| 9 | To save the Offset Sunset | Press 'ENT' Key | Version Displays on Screen |
| 10 | To end | Press 'ENT' Key | Current time displays on the screen |

## Other Settings of Timer

| Step | Function | Key | Display |
| :--- | :--- | :---: | :---: |
| 1 | For Permanent Override ON | Press 'ESC' for 3 sec | Permanent Override ON displays |
| 2 | For Permanent Override OFF | Press 'ESC' for 3 sec | Permanent Override OFF displays |
| 3 | For Auto Mode | Press 'ESC' for 3 sec | Auto Mode Displays |
| 4 | For Lock All Keys | Press 'ENT' for 3 times | Lock 'L' displays |
| 5 | For Unlock All Keys | Press 'ENT' for 3 times | Lock 'L' stop displaying on screen |
| 6 | To end | Press 'ENT' | Current Time displays on screen |
| 7 | To Reset | Press 'RST' for 3 sec | Device reset to factory setting |

Euroload Changeover Switches find a wide application scope wherever the reliability of electrical supply from the utilities is low and are used in lighting/motor circuits wherever continuity of supply is necessary, for switching to an alternative source from main supply and vice versa. They are switch disconnectors with independent manual operation capable of making, carrying and breaking currents under normal circuit conditions which may include operating overload conditions and also carrying currents under specified abnormal circuit conditions such as those of short circuit for a specified time. These switches are modular in construction, compact in size and suitable for stringent utilization category AC-23 A.

## Features:

- Quick make \& quick break mechanism.
- High electrical \& mechanical endurance.
- Advance neutral.
- Enclosed housing to avoid dust ingress.
- Staggered terminals upto 800 A.
- Load and Line reversibility.
- Provision of phase separators, add-on auxiliary switch
- Door interlock and padlock facility.
- Extended outgoing terminals.
- Available in open execution \& in sheet steel enclosure.

## Range :

- 40 A to 3150 A in 7 frame sizes in 4 Pole.

## Specification :

IS / IEC 60947-1 \& 3.

Switch mountings and fitments have been detailed in installation sheets which are supplied with every switch.

Havells On-Load By-Pass Switch connects normal supply to the loads in case stabilized source fails. In fact, it By-passes the UPS/Servo Stabilizer in case of their failure and provides a means of connecting alternate supply to the load. The switch also ensures isolation of the up-stream and down-stream circuit.

## Features:

- Robust and reliable mechanism provides total disconnection.
- Quick make and break operation, independent of the operating speed enables the switches to open and close under stringent conditions, namely AC 23 A utilizations.
- The switch housing is made of fiber glass reinforced polyester, which has excellent mechanical, di-electric and thermal properties.

## Range :

In current ratings of 63 A-1600 A in 6 frame sizes in
4 Pole execution.

## Specification :

IS / IEC: 60947-1 \& 3

## Euroload By-pass Changeover Switch

Construction

## Application

The By-pass switches are designed to meet customer specific needs particularly in IT related industries where UPS and Servo stabilizers provide main source of supply. In the event of an emergency, normal supply can be made available to the services without interrupting any installation and at the same time providing time for maintenance of UPS systems without causing break down of services.

## Operation

The By-pass Switch is operated manually with handle. It provides 3 stable positions namely :

| O | Loads are open circuited |
| :--- | :--- |
| I | Loads are connected to stabilized supply |
| II | Loads are connected to the normal supply |

## Single Line Diagram

At ' 0 ' position, all the contacts of the three disconnectors are open and thereby provide isolation. At 'I' position, disconnectors No. I and III are closed and disconnector II is open. Hence stablized supply is connected to the load. At 'II' position only disconnector No. II is closed and I \& III are open. Hence bypassing the UPS and connecting the load directly to normal supply.

Auxiliary contact :
Auxiliary contacts having I NO. NC or 2 NO. NC configuration can ben provided for indication and signaling purposes.

The need for continuous power supply and its reliability has increased rapidly over the years, especially in all those areas where uninterrupted power supply is a must. Modern systems are power dependent. Their complexity has increased as continuous information and communications are needed to control automated process, be in industries, commercial complexes, hospitals, hotels or even modern residences.
The need, as such, for independent stand by power system has therefore increased manifold. The power distribution, control, monitoring and protection of stand by power system needs to be integrated. Stand by generator systems, for example, are required to cater to :-

- Sensitive Loads are supplied by UPS systems. The period of non-availability of power, before the stand by supply takes over, is bridged by battery banks. Typical loads are computers, hospital equipments, micro processor controlled industrial machines etc.
- Critical Loads mostly involve stand by generator systems which supply power to lighting systems, air conditioning, elevators etc in Airports, Hotels and commercial complexes.
- Essential Loads also use stand by generator systems mostly in process industries as they relate to high restarting times or high down times. Automatic transfer from main supply to stand by supply is vital for all the above kinds of loads.
In the event of power failure, the stand by power is usually expected to take over automatically. Electrical starting equipment, battery bank and diesel generator are required for the automatic operation.
The automatic transfer is achieved mostly by automatic mains failure systems. The process of onload transfer has to be monitored \& controlled for a smooth Changeover and within safety limits of all elements of the system. This is achieved by Automatic Transfer Switch (ATS).

## Features:

- High speed transfer
- Superior making \& breaking capacity
- Compact \& light weight design
- Positive indication through flag indicator
- Neutral point transfer
- Liberal terminals
- Phase barriers Range
- Release operates in 2 modes - automatic and manual

## Range :

Current rating from 100 A to 630 A in
four frame sizes in three pole and four pole execution.

## Specification :

Conforms to IS/IEC:60947-6-1

Automatic Transfer Switch

The Switch comprises of upto four symmetrical poles coupled with the Main Operating Mechanism. The switching mechanism is quick make, quick break type. Load terminals are given on the Lower side but can also be provided on the upper side.

## Contact Mechanism

The contact system is housed in a frame made of Polyester reinforced glass material. Each pole has two independent set of Moving contact assemblies for Main \& standby supply and one Fixed contact assembly for the common outgoing load terminals. The Moving assemblies are mechanically operated by Cams when rotated by the Main Operating Mechanism. Moving Contacts make on to Fixed Contacts under constant pressure with backup spring. Main Contacts are made of Silver-Tungsten to ensure anti-weld characteristics. The Arc Chute plates placed in the path of contact, efficiently quench the Arc and there by enhance the life of the contacts.

## Main Operating Mechanism

The main mechanism independently actuates two sets of Cam linkages, which in turn operate the two independent moving contact assemblies.

The closing command is through a Solenoid Coil supplied with 220 Vac. The operating mechanism always responds by closing on the main supply side and not on to standby supply side, when both supplies are present.

The tripping coil, when energised, is used to bring the ATS to OFF / Neutral position.
Closing on to the standby supply is achieved through the selective coil. The energisation of selective coil, disengages the main mechanism and prevents closing on to the main supply. The solenoid coil can then close the second set of moving contacts on to the standby supply.
The moving contact mechanism of the main supply and the standby supply are inherently mechanically interlocked through a double throw arrangement, which ensures that at no point of time two supplies are paralleled.

Cross Sectional View of Single Pole of ATS

## External view with identification of parts

## Operation

## I-Automatic

In the event of main supply being available, the ATS can be instantaneously switched ON, by the closing coil C, through terminals A1, A2, from its OFF / Neutral position.
If the ATS is ON at the standby supply position, then it is first tripped by the trip coil TC, through terminals BT1 - BT2. This ensures that the two sources of supply are not paralleled. A suitable external control circuit will ensure this, as shown in circuit diagram for Automatic Instantaneous Changeover mode.
The Auxiliary Switches AX or BX, disconnect the closing coil C, once the ATS is ON, thereby the power consumption of the coil $C$ is zero, when the ATS is closed.
To switch the ATS to standby supply, the selective coil SC is first energised. Then the closing coil $C$ is powered through limit swtiches LS and terminals $\mathrm{B}_{1}, \mathrm{~B}_{2}$.
The Trip Coil TC, can be energised through $A T_{1}-A T_{2}$ or $B T 1-B T_{2}$ to switch off the main supply or standby supply.

## II - Manual

Keep selector pressed using a screwdriver

ATS can be operated manually, but as an off-load switch only.
Close on to Main Supply
A manual handle rotates the operating shaft by about $45^{\circ}$ in anticlockwise direction, to achieve closure, under off-load conditions.

## Close on to Standby Supply

Closure on to standby supply side is achieved, when the "selective" mode is continously pressed and the manual handle rotates the operating shaft by about $45^{\circ}$ in anticlockwise direction.
Trip: Tripping can be achieved manually by pressing momentarily through the "Trip Button".
Closing ATS manually to source-II

1. Keep selector pressed using a screwdriver through the selector hole as shown
2. Switch to source-II (mains) by rotating the handle upwards though an angle (approximately $45^{\circ}$ )

## Closing ATS manually to source-I

Switch to source-I (mains) by rotating the handle upwards though an angle (approximately $45^{\circ}$ )

## ATS Controller

## Introduction

- Havells ATS controller can be programmed for both ATS and Changeover (C) configurations.
- Both these configurations can be further operated in both Auto and Manual modes.
- Communication (Start / Stop) feature with DG for automatic starting and stopping of DG.
- In the Changeover mode, no external 12 Vdc supply is required for its operation.
- 3 types of provision for DG start/ stop command- Single Contact, Dual Contact or Pulse Contact.
- Capable of measuring 1 Phase / 3 Phase Voltage of both mains \& DG, along with the mains frequency.
- Inbuilt protection for mains against Under/Over Voltage, Under/Over Frequency and the phase failure.
- Suitable for both Utility-DG and Utility-Utility applications
- Eight LED annunciations on its front panel to indicate the Source \& Contacts Status.
- Records the last 50 events with date and time stamping
- 6 Digit, 2 Row, Alpha Numeric LCD Display with 7 segments for ease of readout.
- True RMS measurement of all measured parameters.
- Display of parameters in the auto scrolling mode which can be enable and disabled.
- Plug in connectors for prompt and error free replacement.

## ATS Configuration:

ATS controller monitors the Mains (S1) supply, if Mains (S1) supply varies beyond set limit of under/over voltage or under/over frequency for more than their individual programmed supervision time, ATS releases the Mains (S1) contacts, trips and the potential free contact(s)* becomes NC to send a command to the AMF controller at DG Set (Source 2) to start it. On restoration of healthy Mains (S1) supply continuously for the programmed duration, the ATS releases the DG Set (Source 2) contacts, trips and the potential free contact(s)* becomes NO which in itself acts as a command to the AMF controller at DG Set (Source 2) to stop it. The load is transferred to the mains $(\mathrm{S} 1$ ) and the generator is stopped after the programmed re-cooling time delay.

## Changeover Configuration:

This is similar to ATS configuration only except that the communication (Start/Stop) with the DG Set (Source2) is disabled. Also, in this mode, no external 12-24 Vdc. supply is required for its operation. The controller monitors the Mains supply, if Mains (S1) supply varies beyond set limit of under/over voltage or under/over frequency for more than their individual programmed supervision time, the ATS releases the Mains (S1) contacts and trips. In case, the source 2 becomes available in healthy condition, it shifts the contacts to DG (Source 2), otherwise it rests in TRIP position only. On restoration of healthy Mains (S1) supply continuously for the programmed duration, the ATS releases the source 2 contacts, trips and shifts the contacts to source1 to transfer the load to the Mains (S1) supply. In this configuration, in case if both the Mains (S1) and DG (S2) supplies are unavailable / unhealthy, then only to turn ON the display, the external 12-24 Vac supply is required.

## *Potential Free Contacts for DG Start/Stop:

There are three types of potential free contacts for DG Start/Stop:
i) Single Contact: Single potential free contact (at 37-38) is used for both Start \& Stop. This potential free contact becomes NC to send a command to the AMF controller at DG Set (Source 2) to start it. And to give the Stop command, these contacts become NO and the same is the position by default also.
ii) Dual Contact: Two separate potential free contacts are used, one each for Start \& Stop to the AMF controller at DG Set (Source 2). To give the Start command, the potential free contact at 37-38 becomes NC and the other at 35-36 remains at NO position. Similarly, to give the Stop command the potential free contact at 35-36 becomes NC while the other at 37-38 becomes NO and the same is the position by default also.
iii) Pulse Contact: This is similar to Dual contact (ii) only, except that the Start/Stop commands are given for a pulse duration (1 second) to the AMF controller at DG Set (Source 2). By default, both the potential free contacts remain at NO position. To give the Start command, the potential free contact at 37-38 becomes NC for a pulse duration of 1 second and then comes back to the NO position. Similarly, to give the Stop command, the potential free contact at 35-36 becomes NC for a pulse duration of 1 second and then comes back to the NO position.

## Display / Front Panel

- 6 Digit, 2 Row, Alpha Numeric, 7 segment display for ease of readout. Parameters are displayed in English. Normally the display auto scrolls and displays a parameter for 10 seconds, but any time the Next key $(\checkmark)$ can be pressed to select the next parameter window.

## Measurements, Protection and Supervision

## Measurements

- 1 Phase/ 3 Phase Voltage of mains
- Mains Frequency
- 1 Phase/ 3 Phase Voltage of DG

## View Event Recording

Last 50 events can be viewed with date and time stamping

## Faults

- Trip Fail
- S1 Close Fail
- S2 Close Fail

## Input and Output

## Potential Free Output:

ATS controller has 3 potential free output as below:

- Hooter (Com.)
- Hooter (NO)
- DG Start/Stop (Com.)
- DG Start / Stop (NO)
- DG Stop (Com.)
- DG Stop (NO)

## Protection / Supervision Mains

- Under/Over Voltage
- Under/Over Frequency
- Phase Fail
- Emergency Trip (ATS)
- Fail To Start (DG/ Source 2)
- Fail To Stop (DG/ Source 2)

## Digital Input:

ATS controller has 6 digital input as below

- MS-1 of ATS
- S1 Closed
- MS-2 of ATS
- S 2 Closed
- Reset
- ATS Trip
- Emergency Trip

## Output:

ATS Controller has 8 outputs :

- A1
- B1
- AT1
- BT1
- A2
- B2
- AT2
- BT2

## Specifications

AC voltage withstand
Surge 1.2/50Usec
Control Supply
Cut out Dimensions
Depth

330 Vac (Phase to neutral)
2.5 kV

Suitable for 12 Vac - 24 Vac (External) Supply
154 mm X 116 mm
72 mm

## LED Annunciations Description:

ATS Controller has eight annunciations on its front panel. These either announce the faults or indicate the supply \& contacts' status of the system.

| Nomenclature | Description |
| :--- | :--- |
| Auto | Led lights up when ATS controller is in Auto mode |
| Manual | Led lights up when ATS Controller is in Manual mode |
| Trip | Led light up when ATS is in tripped position |
| Source 1 | LED lights up continuously if Mains is healthy and starts blinking in case Mains is absent or <br> unhealthy |
| Source 1 Contacts | LED lights up in case the load is connected to Mains (Source 1) |
| Source 2 Contacts | LED lights up in case load is connected to DG (Source 2) |
| Source 2 | LED lights up continuously if Generator supply is healthy and starts blinking in case Generator <br> supply is unhealthy. By default, this LED remains OFF in case DG (S2) is in turned OFF (or <br> Stop) state. |
| Fault | This LED blinks in case of fault |

## Switches Description

ATS Controller has 8 switches provided on its front panel. The table below describes the operation of these.

| Switch Symbols | Switch Function | Description |
| :---: | :---: | :---: |
| (4) | Next | Normal operation mode: In this mode, it is used to change the measured system parameters being displayed on the LCD. <br> Edit Parameter Mode: Next key is used to select or go to the next parameter to be edited. |
| (1) | DG Start | It is used to send the start command to DG (S 2) in Manual mode. |
| (-) | DG Stop | It is used to send the stop command to DG (S 2) in Manual mode. |
| (R) | Reset | It resets the signals of Hooter, Faults, Emergency trip etc. The first press shall reset the hooter and next shall reset the faults. A long press of 1 Sec shall reset the both. |
| (R) 4 | Edit Parameter | If both these keys are pressed simultaneously, then the unit enters Edit Parameter Mode |
| (1) | S 1 | In Edit Parameter mode, it increment the values. <br> In Normal Operation (Manual Mode), it is used to transit load from TRIP to Mains (S 1). |
| (v) | S 2 | In Edit Parameter mode, it decrement the values. <br> In Normal Operation (Manual Mode), it is used to transit load from TRIP to DG Set (S 2). |
| (4/is) | Auto / Manual | It is used to enter the Auto or Manual modes alternatively (on pressing). |
| T | Trip | It is used to trip the ATS (either from Mains (S 1) or DG Set (S 2)). |

## Setting Procedure:

Press Next $\dagger$ \& Reset $®$ switches simultaneously. The LCD shall display, "Edit"
To enter edit Parameter setting mode press $\uparrow$ Next Switch For any change in value in edit parameter press © S1 switch and © S2 switch.
Edit:

| Parameter Name on LCD \& Icon | Explanation of Parameter | Factory Setting | Setting Range |
| :---: | :---: | :---: | :---: |
| SYS Ph | It is possible to select ATS and changeover configurations for any combination of Mains phases ( $1 / 3$ ) and DG phases ( $1 / 3$ ), where "C" indicates the changeover configuration. <br> e.g. the factory setting " C 3M 3G" indicates to operate the ATS in changeover configuration and both Mains and DG are 3-phase systems. | C 3M 3G | C 1M $1 G$ <br> C 3M $1 G$ <br> C 3M 1 aG <br> 1 M 1 G <br> $3 M$ $1 G$ <br> $3 M$ $3 G$ |
| S1 OV | Max. Permissible Mains voltage, above this the Mains voltage is treated unhealthy or over voltage condition. | 270 V | 080-300 V |
| S1 UV | Min. permissible voltage, below this the voltage is treated unhealthy or under voltage condition. | 180 V | 80-300 V |
| VD | Duration for which Mains Over / Under voltage condition is to be tolerated before tripping the ATS. | 10 | 1-999 Sec. |
| OF | Max. permissible Mains frequency, above this frequency the Main is treated unhealthy or over frequency condition. | 55.0 Hz | $40.0-65.0 \mathrm{~Hz}$ |
| UF | Min. permissible Mains frequency, below this frequency the Mains is treated unhealthy or under frequency condition. | 45.0 Hz | $40.0-65.0 \mathrm{~Hz}$ |
| S1 Fd | Time for which the unhealthy Mains frequency is to be tolerated (under or over frequency as defined above) before tripping the ATS. | 10 | 1-999 Sec. |
| S2 PV | This parameter specifies the generator voltage at which it is considered to be in healthy condition. | 200 V | 80-270 V |
| S1 FL | Some application require to trip the ATS on failure of one of the phases. Others want all the 3 phases to become unhealthy before tripping the ATS. The ATS Controller can handle both situations. | 1P FAIL | $\begin{aligned} & \text { 1P FAIL } \\ & \text { 3P FAIL } \end{aligned}$ |
| StRT T | The time, for which the Controller will give starting command to the Generator* | 150 Second | 0-999 Second |
| S2 WT | DG (S2) warm up time after DG build up voltage has crossed the set limit (S2 PV). | 0 Second | 0-999 Second |
| S1 S2 d | User programmable delay when the load is transferred from Generator to Mains. | 2.0 Second | 0-99.9 Second |
| S1 RT | The time for which Mains should be continuously healthy before the load is transferred from DG (S2) to Mains (S1). | 10 Second | 1-999 Second |
| RCOL | The time for which after transfering load to Mains from DG (S2), the DG is allowed to run at no load for cooling. After this time the stop command is sent to the DG (S2). | 10 Second | 1-999 Second |
| C Ty | The type of potential free contacts which goes to the AMF at DG to give the start / stop command (Refer page 10 for potential free contacts). | S CO | $\begin{array}{lll} \hline \text { P CO } & \text { (Pulse) } \\ \text { d CO } & \text { (Dual) } \\ \text { S CO } & \text { (Single) } \\ \hline \end{array}$ |
| StOP T | The time for which the controller gives the stopping command to DG (S2). | 20 Second | 0-999 Second |
| HOOTER | Duration for which the hooter shall be ON (if not externally reset), while announcing a fault or emergency trip. | 30 Second | 0-999 Second |
| AUTO S | Setting ON will enable Auto Scroll of display. Disabling this will not scroll and the next parameters can be viewed by pressing next switch. | ON | ON / OFF |

*Not required in Changeover (C) mode.

## View Event:

Press Next $\Leftarrow$ and Reset $®$ Switches simultaneously. The LCD shall display "Edit".
To go to next menu after the "Edit" press (1) S1 Switch, the LCD shall display "View Event". To View Display Event mode press Next 4 Switch. ATS keeps a log of last 50 events. Parameter change, RTC Change, Mode Change and Fault are considered as event. Events are stamped along with date and time and to view them, keep on pressing Next (4) Switch. To come out of this "View Event" mode, press the Reset $\mathbb{R}$ switch.

## RTC Set:

After the "View Event" is displayed press © S1 Switch, the LCD shall display "RTC set". To change the RTC (real time clock) press $\oplus$ Next Switch. Firstly, the YEAR shall be displayed. For feeding value, use the S1 $\uparrow$ \& S2 $\downarrow$ switches. Then pressing the Next $₫$ switch, MON (Month) will be displayed. Similarly, then date, then SEC (seconds), MIN (minutes) and HOUR (hours) can be edited.

## ATS / Changeover Configuration <br> ATS Configuration

## Auto Mode

ATS controller monitors the Mains (S1) supply, if Mains (S1) supply varies beyond set limit of under/over voltage or under/over frequency for more than their individual programmed supervision time (S1 VD/FD), the ATS releases the Mains (S1) contacts, trips and sends a start command to the DG (S2). After successful start of the Dg (S2), the controller checks for the build-up voltage. If it crosses the limit "S2 PV" then it is considered that the DG supply is healthy. After this, it is allowed to warm up for a user programmed time before the load is transferred to generator.

If generator fails to start within the set "STRT T" time, the fault LED lights up along with the message on the display, indicating the start failure and the hooter is switched on. Also, in case if the DG (S2) voltage drops below the programmed "S2 PV" limit, the ATS trips \& the fault LED lights up along with the message on the display (S2 VOL) and the hooter is switched on.

On restoration of healthy mains supply, continuously for the programmed duration (S1 RT), the ATS trips, the load is transferred to the mains and the controller allows the DG to run on no load for the programmed duration ( RCOL ) for cooling. After this, the controller sends a STOP command to the DG (S2) to stop it.

In case, if the DG (S2) fails to stop within the set 'STOP T' time, the fault LED starts blinking along with the message on the display, indicating the stop failure and hotter is switched ON. To reset the Start / Stop fault, firstly the fault needs to be cleared by making the generator OFF.

## Manual Mode

In this mode, the engine has to be started by manually pressing "DG Start" switch. The "DG Start" switch shall not operate if DG (S2) contact is already closed. Once the DG (S2) is started, the load can be switched to DG (S2) side by pressing "S2" switch. At any given time, any one either Mains (S1) or DG (S2) can be made operational. Attempt of pressing switch "S2" while load is connected to Mains (S1) and vice-versa will be denied. The controller will show a warning message to Trip the ATS first. For tripping, press the "Trip" switch.

To stop the DG (S2), first trip the ATS by pressing "Trip" switch and press "DG Stop" switch. By this, after the delay as per programmed "R COL" time, the controller will send the stop command to the DG (S2). Any attempt to stop the DG (S2), while the DG (S2) contact of ATS is engaged, shall be denied.
During the remote operation, the function of all the switches- "S1", "S2", "Reset" \& "Trip" will remain the same as it was with the switches on the front fascia of the controller unit. Along with this we have "Emergency Trip" command in remote operation which will immediately trip the ATS as required in case of emergency. This emergency tripping will be unlike normal tripping which will light up fault LED and hooter will get ON.

## Changeover (C) Configuration

## Auto Mode

This is similar to ATS configuration only except that the communication (Start/Stop) with the DG (S2) is disabled. Also, in this mode, no external $12-24 \mathrm{Vdc}$. supply is required for its operation. It autmatically takes the power (control supply) from Mains (S1) or DG (S2) which ever is available for its operation. The controller monitors both the supplies, the Source $1 \&$ Source 2, and shift the contacts towards that supply whichever is available in healthy condition continuously for the user programmed duration keeping the Source 1 on priority.
If Source 1 supply varies beyond set limit of under/over voltage or under/over frequency for more than their individual programmed supervision time (S1 VD/ FD), the ATS releases the Source 1 contacts and trips. In case the source 2 becomes available in healthy condition, it shifts the contacts towards Source 2. Otherwise, it rests in TRIP position only.

In case if the load is connected to Source 2 , then on restoration of healthy mains supply continuously for the programmed duration (S1 RT), the ATS releases the Source 2 contacts, trips and shifts the contacts to Source 1 to transfer the load to the Source 1 side. During the transition from TRIP to any of the supplies, if that supply again becomes unhealthy then the fault LED will start blinking indicating the contact failure on that source (S1/S2 CNT Fault) and the hooter is switched ON.

In case both the supplies are unavailable / absent the controller brings the ATS to the trip position. At this time the controller gets switched OFF and it turns ON automatically as soon as anyone of the S1 or S2 becomes available in healthy condition.

## Manual Mode

In this mode, the load can be shifted from one source to another by first pressing the Trip button followed by pressing of that source button (S1 or S2) to which the load is to be shifted. At any given time, either of Source 1 or Source 2 can be made operational. Any attempt to switch on S2 while S1 is ON and vice-versa will be denied with a warning message as "TRIP FIRST" on display. In this Changeover manual mode, unlike ATS manual mode it doesn't require to give the start or stop commands before shifting the load to S 1 or S 2 respectively.
The remote operation is same as in the manual operation of ATS mode.
Note: In ATS configuration, the Controller unit requires 12 to 24 volts DC source input for its functioning. The same needs to be made available from an uninterrupted source such as external battery being used for self start generator set etc.
In Changeover (C) configuration, in case if both the Mains (S1) and DG (S2) supplies are unavailable / unhealthy, then only to turn ON the display, the external 12-24 Vac supply is requried and not for operation.

## Terminal Numbers

## Utilization Scope

Auto Transfer Switch is a self-acting equipment containing the transfer switching devices and other necessary devices for monitoring supply circuits and for transferring one or more load circuits from one supply to another.
The operating sequence of ATS consists of an automatic transfer of a load from the normal supply to an alternate supply in the event of a monitored supply deviation and automatically returning the load to the normal supply when quality of mains supply is restored. The transfer is with a predetermined time delay and includes an interim off position.

In case of both the normal and the alternate supplies being present, the ATS shall assume the normal supply position, which is termed as 'preferred supply'.
The various utilization categories show the most popular applications of Auto Transfer Switch, as per IEC-60947-6-1.

| Nature of <br> current | Utilization Category |  | Typical applications |
| :--- | :---: | :---: | :--- |
|  | Operations A | Operations B |  |
|  | AC-31A | AC-31B | Non-inductive or slightly inductive loads |
| Alternating <br> Current | AC-32 A | AC-32B | Switching of mixed resistive and inductive <br> loads, including moderate overloads |
|  | AC-33 A | AC-33B | Motor loads or mixed loads including <br> motors, resistive loads and up to 30\% <br> incandescent lamp loads |
|  | AC-35 A | AC-35B | Electric discharge lamp loads |
|  | AC-36 A | AC-36B | Incandescent loads |
| Direct <br> Current | DC-31 A | DC-31B | Resistive loads |
|  | DC-33 A | DC-33B | Motor loads or mixed loads including <br> motors |

A wide range of Front Operated Panel Mounting Switch Disconnector Fuse are offered for various power distribution apolications. These_switches have high short circuit making and breaking capacity and are suitable for stringent AC 23 A utilisation category. These can be used for both AC and DC applications.

## Features:

- Front operated, positive break double isolation switch mechanism
- Multi Break arcing contacts per pole for higher electrical life
- Stationary Fuse Links prevent loosening of fuses
- Handle with Padlock, Door interlock and defeat mechanism facility
- Add-on auxiliary switch
- Available in open execution and in sheet steel enclosure.
- Suitable for Aluminium cable termination

## Specification :

Conforms to IS / IEC: 60947-1 \& 3

## Range :

- 32 A to 800 A with bolted type fuse links
- 32 A to 800. A with knife type fuse links
- 32 A to 800 A isolator version.

## Execution :

- Single Pole with Switched Neutral
- Double Pole
- Triple Pole
- Triple Pole \& Neutral
- Triple Pole with Switched Neutral
- Four Pole

## Kompact Switch Disconnector Fuse

## Construction

Havells SDF has been designed and developed to offer solutions sought by discerning customers where ease of installation and operation is required. The switches are compact and available in ratings $32 \mathrm{~A}, 63 \mathrm{~A}, 100 \mathrm{~A}, 125 \mathrm{~A}, 160 \mathrm{~A}, 200 \mathrm{~A}, 250 \mathrm{~A}, 320 \mathrm{~A}, 400 \mathrm{~A}, 630 \mathrm{~A} \& 800 \mathrm{~A}$ with both DIN type and BS type fuses conforming to IEC: 947-3 and IS: 13947-3. The switch is suitable for use in stringent AC 23 A applications.

The complete mechanism is enclosed in a fully insulated DMC moulded housing having excellent combination of mechanical \& electrical properties. Phase barriers are provided for protection against phase to phase flashover.

The switches are designed for base mounting. All steel components are zinc plated, and current carrying parts are silver plated.

## Operating Mechanism

Front handle operation makes possible concise and smaller panels. Sturdy operating handle incorporates features such as fool proof cover locking, inter lock with defeat facility, and padlocking for safety locking in OFF condition. Telescopic adjustable handle shaft is provided for maximum flexibility in order to suit varied mounting positions and to make them compatible to the bus bars.

## Contacts and Contact Mechanism

The contact system comprises of knife type double break contact. These are suppoeted by leaf spring.

Due to the quadrable break per pole (two each on incoming \& outgoing), the fuses are positively isolated from both the ends in "OFF" position ensuring safety during maintenance. They are particularly advantageous in ring distribution network where the network is fed from both sides.

## Enclosures

These switches are normally used in open execution for panel mounting. However, they are also available in enclosures. The enclosures are made of sheet steel which are robustly built, chemically phosphatized and electrostatically powder painted. They are ideally suited for adverse environmental conditions.

Door Interlock

The Handle allows opening of the door in off condition only. In ON position, the door cannot be opened. The interlock can however be by-passed (defeat option on the handle) for maintenance / testing / commissioning. The interlock is restored automatically, on reclosing the panel door

Defeat Facility

For safety reasons the door cannot be opened when the handle is padlocked. The defeat function allows qualified personnel to by-pass the door interlock when the switch is in on position.

Padlocking

Recommended dia. $\phi 5 . . .7 \mathrm{~mm}$ (MAX. 3 nos)

Handle can be padlocked in OFF position as well as in ON position

Switch mountings and fitments have been detailed in installation sheets which are supplied with every switch.

A comprehensive range of Euroload Switch Disconnector (Load Break Switches) have been designed and developed indegenously to meet various needs of distribution circuits. The switches are compact and suitable for AC 23 A duty.

## Features:

- High electrical \& mechanical endurance
- Suitable for Coper and Aluminium cable lug termination
- Contacts and mechanism in enclosed housing to avoid dust ingress
- Double break contacts per pole
- Arc chutes and Arc barriers provided
- Staggered terminals for cable termination upto 400 A / 800 A in 3 pole / 4 pole execution
- Provision of Phase separators
- Easy add-on Auxiliary switch kit
- Separate main \& arcing contacts
- Handle with door interlock and padlock facility.
- Front operated with two stable position : 0-1

## Range :

- 80 A to 400 A in 2 frame sizes in 3 pole
- 40 A to 3150 A in 7 frame sizes in 4 pole execution
with advance neutral.

## Specification :

Conforms to IS / IEC:60947-1\&3

Euroload Switch Disconnector

Construction

The switching mechanism is quick make, quick break type independent of the speed of the operation. There are four breaks per pole thereby resulting into faster quenching of arc. The load and line can be connected on either side by virtue of isolation on both the sides. The entire switching mechanism alongwith the fixed and moving contact assembly are housed in a polyester reinforced, moulded frame/cover, having high dielectric strength \& thermal withstand capacity.

## Contact Mechanism

The contact mechanism is knife blade type with self cleaning action during operation. The fixed contact terminals in each phase have separate main and arcing contacts. The moving contact assembly has three/four sets of contacts on moving carrier and the entire assembly rests on the spring loaded steel balls fitted in moving carrier in rating upto 320 A and spring loaded buttons which assists in its true movement during making and breaking.

The moving contact mates with the fixed contact by a roll and slide movement of the moving contact assembly. The contact is first made with the arcing contact and thereafter with the main contact. During breaking, the arc formation is across the arcing contacts thereby protecting the main contacts which results into enhanced life of the switch. The arc is effectively quenched \& confined by the set of arc chutes / arc barrier in each phase.

The switches can be mounted inside a panel either in horizontal or vertical mode without any effect on the performance.

## Operating Mechanism

The operating mechanism consists of single/double side front operated handle which drives the spring assisted toggle mechanism, inturn operating the switch.

HiBreak range of low voltage HRC based fuse links have been designed to meet the requirements set for modern industrial installations \& electrical power plants. Their breaking capacity is sufficient even for the highest short circuit levels, which are normally reached in practice.
The breaking capacity of the fuse links is 80 kA at 415 AC . The fuse links are suitable for use in both AC/DC applications for over current and short circuit protection and have very low let through energy resulting in reduced electro magnetic stress and reliable short circuit clearance.
They have excellent non-deterioration performance and low power loss values well within the limits of the specification.

## Features:

- Excellent AC and DC performance
- Low watt loss
- Interchangeable with compatible brands
- ISI Marked

## Range :

- 2 A - 800 A in Bolted design (BS Type)
- 6 A - 630 A in Blade Contact design (DIN Type)
- 4 A - 63 A in Round Head design (RH Type)

## Specification :

Conforms to IEC:60269-1 \& 2-1 / IS:13703-1 \& 2-1

Fuse Link

Fuses are of current limiting design \& hence the short curcuit currents cannot rise to the full prospective value owing to the very short clearing time. Adverse effects of the short circuit on the switchgear are thus prevented.

Total operating $\mathrm{l}^{2} \mathrm{t}$
Pre-arcing $1^{12} t$
Positive discrimination under short-circuit conditions is achieved when the higher rated fuse link is unaffected by the fault current, which can cause the lower rated fuse link to operate. The total operating $l^{2 t}$ let through by the lower rated fuse link must be less than the prearcing $l^{2 t}$ of the higher fuse link.

The $1^{2} t$ characteristics of fuse links with a prospective current upto $80 \mathrm{kA}, 0.15$ power factor and at 415 Vac , is shown for quick selection.

HiBreak range of low voltage HRC based DIN fuse base have been designed to meet the requirements set for modern industrial installations \& electrical power plants. Their breaking capacity is sufficient even for the highest short circuit levels, which are normally reached in practice.
DIN Type Fuse Base - Size 00, 1, 2 \& 3 are designed for DIN Type Fuse Links upto 630 A.
The Modular type Fuse Base is available in single pole. Two or more single pole can be connected side by side (straight or diagonally) into 2 pole and 3 pole configuration as per the customer requirement / availability of space.

## Features:

- Fibre glass reinforced Thermoplastic / Thermoset material provide exellent mechanical, thermal \& electrical properties.
- Ease and Speed of installation - by Screws or on DIN Rail.
- Snap on mounting of phase barriers.

## Type:

- Modular
- Fixed

## Range :

100 A to 630 A.

## Specification :

IEC 60269-1 \& 2-1 /
IS 13703-1 \& 2-1.
$\qquad$

## HiBreak DIN Fuse Bases

## Material of Base

Fibre glass reinforced thermoplastic material with high mechanical strength, thermal \& electrical withstand.

## Mounting

By Screws for all sizes of fuse base \& on DIN Rail (only for size 00)

## Phase Barriers

Snap on mounting phase barrier of insulating material to increase creepage distance \& clearance between phases.

## Fuse Contact

Current carrying contacts / terminals are made from precisely pressed copper material and are silver plated to ensure long life \& non-deteriorating contact surface for high efficiency mating.

## Pressure Circlip

Pressure Circlip of spring steel material which do not loose its property at high temperature are suitably placed to ensure perfect mating of male - Fuse and female - Fuse Contact part and maintain sufficient pressure to ensure temperature rise is well within specified limits in continuous operation.

## Moulding (Casing)

The Bases are manufactured from high grade thermosetting plastics. These are non-inflammable \& non-hygroscopic.

## Contacts

Current carrying parts of the holders are made from precisely pressed copper/brass material and have extruded brass base contacts. These are mounted on moulded seats to ensure perfect alignment. The current carrying parts of the fuse base are electro plated with silver to ensure long life \& non-deteriorating contact surface for high efficiency mating.

## Back up Clips

Back up pressure clips are precisely formed from Phosphor Bronze/Spring Steel material to ensure perfect mating of male and female parts for long life.

## Terminals

Copper/Brass terminals are used for cable termination through Cable lugs for open type Fuse Bases complete with Cable holding fasteners.

## Dimension (in mm)

Fixed Type:

Havells Busbar Chamber system is designed for safe, reliable \& economical distribution of power to various loads as per the requirements of the system. The modular construction of the bus bar chamber provides for compact \& easy add-on modules on the basic unit for system expansion (if the need be). These can be wall mounted and can also be made suitable for floor mounting by using optional pedestal set.

## Features:

- Readymade \& customised solution for safe power distridution
- Modular/compact design provides economy of space and cost
- Simple and efficient system configuration
- Easy, flexible and time saving installation
- Shock proof design
- Elegant \& sleek in appearance

## Application :

The busbar chambers find wide application in power distribution in areas namely :

- Construction site
- Shop floor
- Multi-storeyed complexes
- Building installation etc.

## Range :

The busbar chambers are available for $100 \mathrm{~A} / 200 \mathrm{~A}$, $250 \mathrm{~A} / 315 \mathrm{~A} / 400 \mathrm{~A} \& 630 \mathrm{~A} / 800 \mathrm{~A}$ current ratings with short circuit withstand capacity of $25 \mathrm{KA}, 35 \mathrm{KA}$ \& 50 kA respectively. These are offered in 4 way, 6 way \& 8 way in Four Pole configuration.

## Specification:

Fully application oriented as per
IS:8623 / IEC 60439 (Panel sub assemblies)
IS: 2147 / IEC60529 (Degree for protection)

Busbar Chamber System

## Optima

Ready made \& customised solution for safe power distribution

- Incoming from Top / Bottom \& Centre by rotation of enclosure
- Outgoing provision from Left / Right and Top / Bottom side
- Enclosure can be mounted vertically and horizontally
- Removable gland plate with knock out provision
- Liberal space between cable / busbar and live parts

## Busbar Chamber

## Introduction

Havells new Optima Busbar Chamber System is designed for safe, reliable \& economical distribution of power to various loads as per the requirements of the system. The busbar chamber conforms to IEC-61439-3 / IS-8623 \& IEC-60529 / IS-2147.

## Construction

The busbar chamber is fabricated using sheet steel (CRCA) and epoxy powder coated to give superior \& lasting finish. The bus bar sections are made of ETP grade copper \& dull tin plated and the bus bar supports are made of DMC (Dough moulding compound). Left \& Right side end
 plates are detachable.

A comprehensive range of General Purpose Load Changeover Switches with side handle operation find wide application in all general industries where individual system require safe and reliable transfer of power from main supply to standby supply and vise versa.
Load Changeover Switches are supplied in Sheet Steel enclosure, side operated with three stable positions; I-O-II, (centre-off position).

## Features:

- Suitable for individual mounting, inner mounting holes and mounting brackets provided in enclosures.
- Sheet steel enclosure duly phosphatised and powder painted for longer life.
- Provision for door interlocking.
- Termination suitable for Aluminum cables, adequate knockouts provided in the enclosure for cable entry.

## Range :

Onload Changeover Switch - AC 23 (side handle)

- 32 A, 63 A, 240 V in Double Pole version
- 32 A-100 A, 415 V in Three Pole version
- 16 A-100 A, 415 V in Four Pole version

Offload Changeover Switch - AC 20 A (side handle)

- 200 A - 2000 A, 415 V in Four Pole version

## Specification :

Conforms to IS / IEC:60947-1\&3

## Load Changeover Switch

## Contacts

Contacts are made of silver plated, electrolyte copper to increase current carrying capacity, ensure temperature rise within permissible limits and for long contact life.

## Operating Handle and Interlocking

The operating handle is made of steel and is provided on the right hand side of the switch enclosure. Door interlock ensures the door cannot be opened when the switch is in ON position thereby providing safety.

## Terminal Blocks

Terminal blocks are provided for cable termination. These are made of DMC/Porcelain which has excellent mechanical, thermal and dielectric properties.

## Enclosure:

The enclosure is made of sheet steel suitable for individual mounting. They are provided with adequate knockout for cable entry and inner mounting holes for switch ratings upto 320 A and mounting brackets for switch rating of 400 A and above.

A complete range of HRC based Fuse Switch \& Switch Fuse units are offered to suit varied power distribution applications. The heavy duty Fuse Switches are fully type tested with short circuit breaking capacity of 80 kA at 415 V suitable for utilisation category AC $22 \mathrm{~A} / \mathrm{AC} 23 \mathrm{~A}$. Four frame sizes cover the full range.

The Switch Fuse units are suitable for utilisation category AC 22 A.

## Features:

Fuse Switches

- Double break with side handle operation
- Positive indication of contacts
- Suitable for surface mounting
- Door interlock facility
- Sheet steel enclosure duly phosphatised and powder painted

Switch Fuses

- Side handle operation
- Suitable for surface mounting
- Sheet steel enclosure duly phosphatised and powder painted
- Provision of conduit knockouts and detachable gland plates.

## Range :

Fuse Switch
63 A to 800 A in TPN \& FP Execution
16 A to 63 A in SPN / DP Execution
16 A to 320 A in TPN Execution

## Specification :

Conforms to IS / IEC:60947-1\&B

## Fuse Switch \& Switch Fuse

Construction

## Fuse Switch

Fuse Switch units are fitted with sturdy side operating handle which drives the quick makebreak mechanism incorporating operating springs. Liberal sized silver plated terminals, suitable for aluminium cable/bus-bar termination, are provided with terminal cover shields to prevent any accidental contact with live metal parts. Positive ON-OFF indication is provided on the switch door.

Contacts
Contacts are made of electrolytic copper, electro-plated with silver, for better contact and greater resistance to corrosion. Specially designed female contacts ensure low contact resistance and better arc-control.

## Fuses

Fuse switches are designed for use with HBC Cartridge fuselinks conforming to IS:13703.

## Enclosures

The enclosure is made of sheet steel, rust protected, phosphatized and powder coated. They are fitted with removable top and bottom end plates provided with knock-outs for bus bars/cables entry. Front accessible door, fitted with dust-excluding gasket, is interlocked to prevent opening when the switch is in 'ON' condition. They are suitable for surface mounting.

## Switch Fuse

Switch Fuse Unit comprises of vitreous steatite porcelain rewireable fuses or HBC fuse fittings complete with their conducting parts. The switch is fitted with sturdy side operating handle with quick make-break type mechanism.

## Contacts

Contacts are made of electrolytic copper, silver-plated. The fixed contacts are provided with removable shield.

## Fuses

Switch Fuse units are pvovided with rewirable fuse or HBC Fuse Links.

## Enclosures

The Enclosure is made of sheet steel duly phosphatised and power-coated. They are pvovided with conduit knock-outs and have detachable gland plates. Door interlock is provided to prevent opening when the switch is in 'ON' condition.
